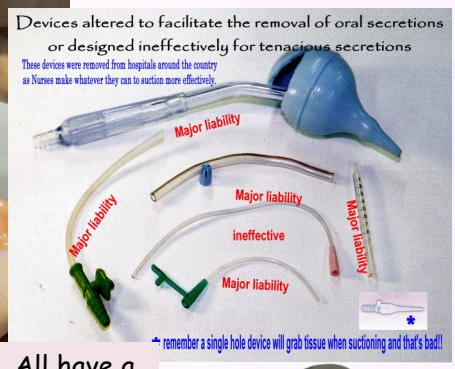
The Problem:



All have a single-hole at distal end.

The Solution:

- Patented
- 2 or more holes
- Bebeonkers have 3
- Does not grab tissue
- No trauma
- No harm

There has never been an effective device for suctioning intubated or newborn infants. Doctors, nurses and therapists have been using, or creating inferior one-hole devices. This endangers infants and makes hospitals and medical professional liable if an infant is injured. "BEBEONKERS" is the right device!!! Two or more holes, flexible and a tapered inner wall does the job quickly without damaging tissue.

Bebeonkers I

Bebeonkers I (16-1) was designed with a bulb-tip to form a seal on the outer nares to facilitate quick removal of secretions, both nasally and orally, and still retain a three-hole configuration for safe oral care without hurting baby.

Flexible & Soft

Bebeonkers II (16-2), our original patented design, is an oral/ nasal suction device that does not grab tissue and effectively removes the most tenacious secretions quickly and without injury.
Now available: 16-0 Webeonkers for the ultra-preemie infant. Like the 16-2 but smaller.
Packaged six per bag.

Order #	Product Description	Bx Qty
