ARE YOU HAVING PLASTIC FOR DINNER?

Plastic never goes away. It breaks down into smaller pieces which end up everywhere. EVEN IN OUR FOOD!

Microscopic pieces of plastic have been found in the most remote places - from the depths of the ocean to frozen arctic ice. Microplastics have even been found in our bodies! Scientists are still investigating the impact that plastic has on human health and marine ecosystems.

LEARN MORE AT TALKINGTRASH4CLEANOCEANS.ORG

The average person could be consuming up to 50 teaspoons of plastic every year!

This poster was created by Talking Trash Interns - an internship funded by the NOAA Marine Debris Prevention Program led by Salem Sound Coastwatch, in partnership with Girls Inc of Lynn.
