# The Highest Quality W ater

The SFPUC's Water Quality Division regularly collects and tests water samples from reservoirs and designated sampling points throughout the system to ensure that the SFPUC's water meets or exceeds federal and state drinking water standards. In 2008 Water Quality staff conducted 56,200 drinking water tests in the transmission and distribution systems. This monitoring effort is in addition to the extensive process control monitoring performed by SFPUC certified treatment plant staff.

As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Such substances are called contaminants. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk.

The table on the inside lists all drinking water contaminants detected in 2008. Contaminants below detection limits, such as arsenic, perchlorate, MIEE, and others, are not listed. In the same year, SFFUC also completed four quarters of monitoring 25 contaminants that are not required under the USEPA second Unregulated Contaminant Monitoring Regulation. All 25 contaminants were not detected in the water supplied to you. The list of these contaminants is available at the USEPA website:

http://www.epa.gov/sefevater/umr/umr2/besicinformation.htm#list

The table contains the name of each contaminant, the applicable drinking water standards or regulatory action levels, the ideal goals for public health, the amount detected in water, the typical contaminant sources, and footnotes explaining the findings. The State allows the SFFUC to monitor for some contaminants less than once per year because their concentrations do not change. For certain other contaminants that were absent in the water based on many years of monitoring, the SFFUC received a monitoring waiver from the State.

### Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally occurring or result from urban stomwater nuroff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater nunoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the U.S. Environmental Protection Agency (USEPA) and the California Department of Public Health (CDPH) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. CDPH regulations also establish limits for contaminants in bottled water that must provide the same protection for public health. More information about contaminants and potential health of fects can be obtained by calling the USEPA 's Safe Drinking W ater Hotline (1-800-426-4791)

Cryptosporidium is a parasitic microbe found in surface water. The SFRU regularly tests for this waterborne pathogen, and found it at very low levels in source water and treated water in 2008. However, current test methods approved by the USEPA do not distinguish between dead organisms and those capable of causing disease. If ingested these parasites may produce symptoms of nausea, stomach cramps, diarrhea, and associated headaches.

# Lead and Copper Sampling Volunteers for 2009

Mid Peninsula W ater District will be asking for volunteers for a tap sample for Leed and Opper in 2009. This service is free of charge and results of the test will be provided to the volunteers. The exact date has not been determined but will take place during the months of June, July August or September. If your home has copper pipes with lead solder that was installed between 1982 and 1988 and wish to volunteer please contact our office at 650-591-8941.

#### Special Health Needs

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking W ater Hotline (1-800-426-4791) or at www.epa.gov/safewater.

#### To Learn More

Want to learn more about drinking water regulations? Visit the CDH website at www.colph.ca.gov or the USEPA website at www.epa.gov.

# Mid-Peninsula W ater District 2008 Annual W ater Quality Report

"This report contains important information about your drinking water. Translate it, or speak with someone who understands it."

Spanish: "Este informe contiene información muy importante sobre su agua potable. Tradúzcalo o hable con alguien que lo entienda bien."

Tacalog: "Wahalaga ang impormasyong ito. Mangyaring ipasalin ito."

French: "Ce rapport contient des informations importantes concernant votre eau potable. Veuillez traduire, ou parlez avec quelqu'un qui peut le comprendre."

Polish: "Ta broszura zawiera wazne informacje dotyczace jakości wody do picia. Przetlumacz zawartość tej broszury lub skontaktuj sie z osoba ktora pomoże ci w zrozumieniu zawartych informacji."

The Mid-Peninsula Water District is pleased to present this 2008 Annual Water Quality Report (Consumer Confidence Report) to our customers. It is important to our Board of Directors and Staff that our customers are informed about the quality of their drinking water. The Mid-Peninsula Water District exists to serve our customers by dataining and distributing a safe, reliable, high quality supply of water for current and future needs in the most cost of ficient manner. Should you have any questions or concerns regarding this report, please feel free to call the District Of fice at (650) 591-8941 and one of our Of fice Specialists or Technicians will be happy to assist you.

#### Where SFPUC W ater Comes From

In 2008 the Hetch Hetchy watershed provided approximately 84% of our total water supply with the rest supplemented by local watersheds.

#### Protecting Our W atersheds

The SFRC actively and aggressively protects the natural water resources entrusted to its care. An annual report on the Hetch Hetchy and its neighboring watersheds is prepared to evaluate their sanitary conditions, water quality, and potential contamination sources. The report also presents performance results of watershed management activities implemented by the SFRC and its partner agencies, such as the National Park Service, to reduce or eliminate the potential contamination sources. The 2008 sanitary survey concludes that very low levels of contaminants associated with wildlife and human activities exist in these up country watersheds.

The SFFUC also conducts sanitary surveys of the two local watersheds every five years. The potential contamination sources identified in the 2005 survey are similar to the up country watersheds. These survey reports are available at the San Francisco District office at (510-620-3474) of the California Department of Public Health.

# Our Drinking Water Sources

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, pands, reservoirs, springs, and wells. For our system, the major water source originates from spring snowmelt flowing down the Tuolume River to the Hetch Hetchy Reservoir, where it is stored. This pristine water source is located in the well-protected Sierra region and meets all federal and state criteria for watershed protection. Based on the SFPUC's disinfection treatment practice, extensive bacteriological-quality monitoring, and high operational standards, the State has granted the Hetch Hetchy water source a filtration exemption. In other words, the source is so clean and protected that the SFPUC is not required to filter water from the Hetchy Reservoir.

The remaining water in the supply consists of surface water collected from two local watersheds. Rainfall and nuroff collected from the Alameda W atershed, which spans more than 35,000 acres in Alameda and Santa Clara Counties, are captured in Calaveras and San Antonio Reservoirs. Prior to distribution, the water from these two reservoirs is treated at the Sunol Valley W ater Treatment Plant (SWIP). Treatment processes include coagulation, floculation, sedimentation, filtration, and disinfection. Fluoridation, chloramination and corrosion control treatment are provided for the combined Hetch Hetchy and SWIP water at the Sunol Chloramination and Fluoridation Facilities.

Rainfall and runoff captured in the 23,000-acre Peninsula W attershed, located in San Mateo County, are stored in four reservoirs: Crystal Springs (Lower and Upper), San Andreas, Pilancitos, and Stone Dam. The water from these reservoirs is treated at the Harry Tracy W atter Treatment Plant (HIWIP). Treatment processes include ozonation, coagulation, filoculation, disinfection, fluoridation, chloramination, and corrosion control treatment.

# MPWD Board Meetings Held Every 4th Thursday of Every Month

The Mid-Peninsula W ater District Board of Directors hold a Board Meeting on the 4th Thursday of each month. Customers are encouraged to attend these meetings. The meetings are held at our District Office at 3 Dairy Lane, Belmont at 6:30 p.m.

DETECTED CONTAMINANTS	Unit	MCL	PHG or (MCLG)	Range or Level Found	Average or (Maximum)	Typical Sources in Drinking Water

N/A

# (1) All results met State and Federal drinking water regulations.

Silica

Sodium

- (2) Turbidity is a water clarity indicator; it also indicates the effectiveness of the filtration plants.
- (3) Turbidity is measured every four hours. These are monthly average turbidity values.
- (4) This is the highest single measurement in 2008. The start up of San Joaquin Pipeline No. 2 caused elevated turbidities on 3/13/08 as a result of sediment resuspension in the pipeline.

ppm

ppm

- (5) There is no MCL for turbidity. The limits are based on the TT requirements in the State drinking water regulations.
- (6) This is the highest guarterly running annual average value.
- (7) Total Organic Carbon is a precursor for disinfection by-product formation The TT requirement applies to the filtered water from the SVWTP only.
- (8) The Mid-Peninsula Water District had 0 positive samples in 2008
- (9) The SFPUC adds fluoride to the naturally occurring level to help prevent dental caries in consumers. Target dose of 1.0 mg/L in M.P.W.D. drinking water.
- (10) The naturally occuring fluoride levels in the Hetch Hetchy and SVWTP are ND and 0.15 ppm, respectively.
- (11) Latest round of Lead and Copper Rule monitoring was in 2006. 0 out of 30 residences were over the copper action level at consumer taps.
- (12) Latest round of Lead and Copper Rule monitoring was in 2006. 0 out of 30 residences were over the lead action level at consumer taps.
- (13) There was no chlorate detected in the raw water sources. The deteceted chlorate in the treated water is a byproduct of the degradation of sodium hypochlorite, the primary disinfectant used by SFPUC for water.

Note: Additional water quality data may be obtained by calling the Mid-Peninsula Water District phone number at (650) 591-8941.

# Key:

< /  $\leq$  = less than / less than or equal to

AL = Action Level

cyct/L = cycts per liter

Max = Maximum

Min = Minimum

N/A = Not Available

ND = Non-detect

NL = Notification Level

NTU = Nephelometric Turbidity Unit

ORL = Other Regulatroy Level

ppb = parts per billion

ppm = parts per million

μS/cm = microSiemens/centimeter

# How Your Water Measures Up

Following are definitions of key terms noted on the adjacent water quality data chart. These terms refer to the standards and goals for water quality described below.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHCs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health.

MCLGs are set by the USEPA.

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Maximum Residual Disinfectant Level (MRDL): The level of a disinfectant added for water treatment that may not be exceeded at the consumer 's tap.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a disinfectant added for water treatment below which there is no known or expected risk to health. MRDLGs are set by the USEPA.

Primary Drinking W ater Standard (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

W ater System Improvement Program (WSIP) Update: New UV Treatment Facility Planned for Hetch Hetchy System

Projects that enhance high water quality are a key component of the multi-billion dollar WSIP, a program developed to upgrade the SFPUC water delivery system.

The SFPUC's fiture Advanced Disinfection Project will use ultraviolet (UV) light to disinfect Hetch Hetchy water to meet new federal requirements to control the waterborne parasite Cryptosporidium. The new 20,000-square-foot facility, inside a SFPUC property in San Joaquin County, will be one of the largest drinking-water UV disinfection facilities in North America. In the same location, a new disinfection station with control room, of fices and a water-quality laboratory, will replace the present station, which was built in 1937 and no longer meets current fire or earthquake safety standards

Also under way are major upgrades of the SWIP in the East Bay and the HIWIP

For further information on these and other WSIP water quality projects, visit  $w\,w\,w.stwater.org$
