CERTIFIED MAIL

Col Adam G. Wiggins, Commander
Rhode Island Air National Guard/143rd AW/EM
2 Hercules Drive
Quonset ANGB
North Kingstown, RI 02852-7502

**RE: Rhode Island Air National Guard (RIANG)/143rd Airlift Wing (AW)
Final Permit No. RI0021555**

Dear Colonel Wiggins:

Enclosed is the final Rhode Island Pollutant Discharge Elimination System (RIPDES) Permit issued for the RIANG/143rd AW site located at 2 Hercules Drive in North Kingstown, RI. State regulations, promulgated under Chapter 46-12 of the Rhode Island General Laws of 1956, as amended, require this permit to become effective on the date specified in the permit.

Also enclosed is information relative to hearing requests and stays of RIPDES Permits.

We appreciate your cooperation throughout the development of this permit. Should RIANG have any questions concerning this permit, feel free to contact Aaron Mello of the State Permits Staff at (401) 222-4700, extension 2777405.

Sincerely,

A handwritten signature in black ink, appearing to read "Joseph B. Haberek".

Joseph B. Haberek, P.E.
Acting Administrator of Surface Water Protection
Office of Water Resources

RESPONSE TO COMMENTS

NO SIGNIFICANT COMMENTS WERE RECEIVED ON THE DRAFT PERMIT FOR THIS FACILITY; THEREFORE, NO RESPONSE WAS PREPARED.

HEARING REQUESTS

If you wish to contest any of the provisions of this permit, you must request a formal hearing within thirty (30) days of receipt of this letter. The request should be submitted to the Administrative Adjudication Division at the following address:

Mary Dalton, Clerk
Department of Environmental Management
Office of Administrative Adjudication
235 Promenade Street
3rd Floor, Rm 350
Providence, RI 02908

Any request for a formal hearing must conform to the requirements of §1.50 of the Regulations for the Rhode Island Pollutant Discharge Elimination System (RI Code of Regulations; 250-RICR-150-10-1.50).

STAYS OF RIPDES PERMITS

Should the Department receive and grant a request for a formal hearing, the contested conditions of the permit will not automatically be stayed. However, the permittee, in accordance with §1.51 of the Regulations for the Rhode Island Pollutant Discharge Elimination System (RI Code of Regulations; 250-RICR-150-10-1.51), may request a temporary stay for the duration of adjudicatory hearing proceedings. Requests for stays of permit conditions should be submitted to the Office of Water Resources at the following address:

Joseph B. Haberek, P.E.
Acting Administrator of Surface Water Protection
Office of Water Resources
235 Promenade Street
Providence, Rhode Island 02908

All uncontested conditions of the permit will be effective and enforceable in accordance with the provisions of §1.50 of the Regulations for the Rhode Island Pollutant Discharge Elimination System (RI Code of Regulations; 250-RICR-150-10-1.50).

AUTHORIZATION TO DISCHARGE UNDER THE
RHODE ISLAND POLLUTANT DISCHARGE ELIMINATION SYSTEM

In compliance with the provisions of Chapter 46-12 of the Rhode Island General Laws, as amended, the

Rhode Island Air National Guard

is authorized to discharge from a facility located at

Quonset State Airport
2 Hercules Drive
North Kingstown, RI 02825

to receiving waters named

Frys Pond

in accordance with effluent limitations, monitoring requirements and other conditions set forth herein.

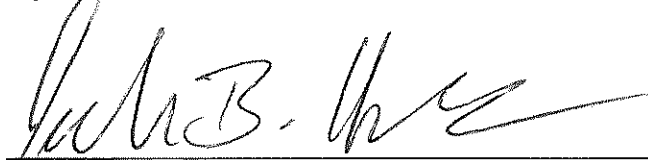

This permit shall become effective on January 1, 2022.

This permit and the authorization to discharge expire at midnight, five (5) years from the effective date.

This permit supersedes the permit issued on October 27, 2015 and modified on December 14, 2016.

This permit consists of 24 pages in Part I including effluent limitations, monitoring requirements, etc. and 10 pages in Part II including General Conditions.

Signed this 28th day of December 2021.

Joseph B. Haberek, P.E., Acting Administrator of Surface Water Protection
Office of Water Resources
Rhode Island Department of Environmental Management
Providence, Rhode Island

A. EFFLUENT LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning on the effective date and lasting through permit expiration, the permittee is authorized to discharge from Outfall serial number 100A. Such discharges shall be limited and monitored by the permittee as specified below:

Effluent Characteristic	<u>Discharge Limitations</u>			Concentration - specify units		<u>Monitoring Requirement</u>	
	Quantity - lbs./day		Average Monthly	Average	Maximum	Measurement Frequency	Sample Type
<u>Monthly</u>	<u>Daily</u>	--- MGD		Weekly	<u>Daily</u>		
Flow						Continuous	Continuous ¹
Oil & Grease					15 mg/l	1/Quarter	Grab ²
TSS					20 mg/l	1/Quarter	Grab ²
Benzene					--- ug/l	1/Quarter	Grab ²
Toluene					--- ug/l	1/Quarter	Grab ²
Ethylbenzene					--- ug/l	1/Quarter	Grab ²
Total Xylenes					--- ug/l	1/Quarter	Grab ²
Polynuclear Aromatic Hydrocarbons (PAHs)							
Acenaphthene					--- ug/l	1/Quarter	Grab ²
Acenaphthylene					--- ug/l	1/Quarter	Grab ²
Anthracene					--- ug/l	1/Quarter	Grab ²
Benzo (a) anthracene					--- ug/l	1/Quarter	Grab ²
Benzo (a) pyrene					--- ug/l	1/Quarter	Grab ²
Benzo (b) fluoranthene					--- ug/l	1/Quarter	Grab ²
Benzo (ghi) perylene					--- ug/l	1/Quarter	Grab ²
Benzo (k) fluoranthene					--- ug/l	1/Quarter	Grab ²

A. EFFLUENT LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning on the effective date and lasting through permit expiration, the permittee is authorized to discharge from Outfall serial number 100A. Such discharges shall be limited and monitored by the permittee as specified below:

<u>Effluent Characteristic</u>	<u>Discharge Limitations</u>					<u>Monitoring Requirement</u>	
	Quantity - lbs./day		Concentration - specify units			Measurement <u>Frequency</u>	Sample <u>Type</u>
	<u>Average Monthly</u>	<u>Maximum Daily</u>	<u>Average Monthly</u>	<u>Average Weekly</u>	<u>Maximum Daily</u>		
Chrysene					--- ug/l	1/Quarter	Grab ²
Dibenzo (a,h) anthracene					--- ug/l	1/Quarter	Grab ²
Fluoranthene					--- ug/l	1/Quarter	Grab ²
Fluorene					--- ug/l	1/Quarter	Grab ²
Indeno (1,2,3-cd) pyrene					--- ug/l	1/Quarter	Grab ²
Naphthalene					--- ug/l	1/Quarter	Grab ²
Phenanthrene					--- ug/l	1/Quarter	Grab ²
Pyrene					--- ug/l	1/Quarter	Grab ²

--- Signifies a parameter which must be monitored and data must be reported; no limit has been established at this time.

¹ Flow shall be determined by the use of a continuous flow monitor.

² One (1) sample shall be taken during wet weather. Prior to the upgrades noted below, wet weather samples must be collected during the first 30 minutes from discharges resulting from a storm event that is greater than 0.1 inch of rainfall in a 24-hour period and at least 72 hours from the previously measurable (greater than 0.1 inch of rainfall in a 24-hour period) storm event. If this is not feasible, wet weather samples may be taken within the first hour of discharge and noted on the Discharge Monitoring Report.

Samples taken in compliance with the monitoring requirements specified above shall be taken at the following location: Outfall 100A (Storm water from the Petroleum based fuels, oil or lubricants (POL) Facility yard area/tanker truck parking area after treatment and prior to commingling with off-site storm water inputs. (1) Prior to the POL Facility upgrades, the sampling location must be immediately downstream from the 8,000-gallon oil/water separator. (2) Following the POL Facility upgrades, storm water will be collected immediately downstream from the Jellyfish Filter.

A. EFFLUENT LIMITATIONS AND MONITORING REQUIREMENTS

2. During the period beginning on the effective date and lasting through permit expiration, the permittee is authorized to discharge from Outfall serial number 100B. Such discharges shall be limited and monitored by the permittee as specified below:

<u>Effluent Characteristic</u>	<u>Discharge Limitations</u>					<u>Monitoring Requirement</u>	
	Quantity - lbs./day		Concentration - specify units			<u>Measurement Frequency</u>	<u>Sample Type</u>
	<u>Average Monthly</u>	<u>Maximum Daily</u> --- MGD	<u>Average Monthly</u>	<u>Average Weekly</u>	<u>Maximum Daily</u>		
Flow						Continuous	Continuous ¹

TSS					20 mg/l	1/Quarter	Grab ²
Benzene					--- ug/l	1/Quarter	Grab ²
Toluene					--- ug/l	1/Quarter	Grab ²
Ethylbenzene					--- ug/l	1/Quarter	Grab ²
Total Xylenes					--- ug/l	1/Quarter	Grab ²
Polynuclear Aromatic Hydrocarbons (PAHs)							
Acenaphthene					--- ug/l	1/Quarter	Grab ²
Acenaphthylene					--- ug/l	1/Quarter	Grab ²
Anthracene					--- ug/l	1/Quarter	Grab ²
Benzo (a) anthracene					--- ug/l	1/Quarter	Grab ²
Benzo (a) pyrene					--- ug/l	1/Quarter	Grab ²
Benzo (b) fluoranthene					--- ug/l	1/Quarter	Grab ²
Benzo (ghi) perylene					--- ug/l	1/Quarter	Grab ²
Benzo (k) fluoranthene					--- ug/l	1/Quarter	Grab ²

A. EFFLUENT LIMITATIONS AND MONITORING REQUIREMENTS

2. During the period beginning on the effective date and lasting through permit expiration, the permittee is authorized to discharge from Outfall serial number 100B. Such discharges shall be limited and monitored by the permittee as specified below:

Effluent Characteristic	<u>Discharge Limitations</u>					<u>Monitoring Requirement</u>	
	Quantity - lbs./day		Concentration - specify units			Measurement Frequency	Sample Type
	Average Monthly	Maximum Daily	Average Monthly	Average Weekly	Maximum Daily		
Chrysene					--- ug/l	1/Quarter	Grab ²
Dibenzo (a,h) anthracene					--- ug/l	1/Quarter	Grab ²
Fluoranthene					--- ug/l	1/Quarter	Grab ²
Fluorene					--- ug/l	1/Quarter	Grab ²
Indeno (1,2,3-cd) pyrene					--- ug/l	1/Quarter	Grab ²
Naphthalene					--- ug/l	1/Quarter	Grab ²
Phenanthrene					--- ug/l	1/Quarter	Grab ²
Pyrene					--- ug/l	1/Quarter	Grab ²

--- Signifies a parameter which must be monitored and data must be reported; no limit has been established at this time.

¹ Flow shall be determined by the use of a continuous flow monitor.

² One (1) sample shall be taken during dry weather. Dry weather samples must be collected during the controlled release of storm water within the Petroleum-based fuels, oil or lubricants (POL) Facility secondary containment area(s) with proper allowances for hydraulic detention time (time for flow to travel from the oil/water separator to the sampling location).

Samples taken in compliance with the monitoring requirements specified above shall be taken at the following location: Outfall 100B (storm water from the POL Facility secondary containment area(s) after treatment and prior to commingling with off-site storm water inputs. (1) Prior to the POL Facility upgrades, the sampling location must be immediately downstream from the 8,000-gallon oil/water separator. (2) Following the POL Facility upgrades, storm water will be collected immediately downstream from the Jellyfish Filter.

3.
 - a. The pH of the effluent shall not be less than 6.5 nor greater than 9.0 standard units, unless these values are exceeded due to natural causes.
 - b. The discharge shall not cause visible discoloration of the receiving waters.
 - c. The discharge shall not cause odors in the receiving water to such a degree as to create a nuisance or interfere with the existing or designated uses.
 - d. The effluent shall contain neither a visible oil sheen, foam, nor floating solids at any time.
 - e. The discharge shall not cause stream bank erosion and/or any soil erosion and sedimentation.
4. The permittee shall not add chemicals (including but not limited to disinfecting agents, detergents, emulsifiers, and "bioremedial agents including microbes") to the collection and treatment system without prior approval from DEM.
5. The permittee shall not discharge any sludge and/or bottom deposits from any storage tank, basin and/or diked area to the receiving water. Examples of storage tanks and/or basins include, but are not limited to: catch basins, stilling basins, oil/water separators, observation basins, petroleum product storage tanks, storage tanks collecting spills, and tank truck loading rack sumps.
6. This permit does not authorize discharges to the separate storm sewer system or to waters of the State from floor drains and trench drains located inside of buildings and/or hangars.
7. The permit does not authorize discharges to the separate storm sewer system or to waters of the State from vehicle, aircraft, or equipment washing activities, except for clear water rinses of C-130J aircraft as documented in the facility's Storm Water Pollution Prevention Plan (SWPPP) required in Part I.C. and as an allowable non-storm water discharge in Part I.A.14.
8. This permit does not authorize the discharge of sanitary wastewater to the separate storm sewer system or to waters of the State.
9. The discharge of contaminated groundwater, including contaminated groundwater from infiltration/inflow, into the storm water collection system or into any oil/water separator is prohibited.
10. There shall be no discharge of tank bottom draw-off water (water which separates from product during storage and settles to the tank bottom) to the separate storm sewer system or to waters of the State.
11. There shall be no discharge of tank and/or piping hydrostatic-test water, and tank and/or pipe cleaning residual/debris associated with hydrostatic-testing procedures to the separate storm sewer system or to waters of the State.
12. Discharges from rubber removal practices and dry weather discharges of deicing/anti-icing chemicals are not authorized by this permit. Dry weather discharges are those discharges generated by processes other than storm water runoff, snowmelt runoff, and surface runoff and drainage. Discharges of process wastewater or spills in snowmelt runoff are not authorized by this permit.

13. There shall be no discharge of fire protection foam, either in concentrate form or as foam dilute with water, not associated with firefighting activities to the separate storm sewer system or to waters of the State.
14. Unless identified by the permittee or the DEM as significant sources of pollutants to waters of the United States, the following non-storm water discharges are authorized under this permit to enter the storm water drainage system: discharges from firefighting activities; fire hydrant flushings; routine external building washdown / power wash water that does not use detergents or hazardous cleaning products (such as those containing bleach, hydrofluoric acid, muriatic acid, sodium hydroxide, nonylphenols); lawn watering; uncontaminated groundwater; springs; air conditioning condensate; potable waterline flushings; clear water rinses of C-130J aircraft; irrigation drainage; foundation or footing drains where flows are not contaminated with process materials, such as solvents, or contaminated by contact with soils, where spills or leaks of toxic or hazardous materials have occurred; water sprayed for dust control or at a truck load wet-down station; incidental windblown mist from cooling towers that collects on rooftops or adjacent portions of the facility, but NOT intentional discharges from the cooling tower (e.g., "piped" cooling tower blowdown or drains); uncontaminated utility vault dewatering; dechlorinated water line testing water; hydrostatic test water that does not contain any treatment chemicals and is not contaminated with process chemicals; and discharges from washing of vehicles provided: chemicals, soaps, detergents, hazardous cleaning products (such as those containing bleach, hydrofluoric acid, muriatic acid, sodium hydroxide, nonylphenols), steam, or heated water are not used; cleaning is restricted to the outside of the vehicle (e.g., no engines, transmissions, undercarriages, or truck beds); or washing is not used to remove accumulated industrial materials, paint residues, heavy metals or any other potentially hazardous materials from surfaces. If any of these discharges may reasonably be expected to be present and to be mixed with storm water discharges, they must be specifically identified and addressed in the facility's Storm Water Pollution Prevention Plan (SWPPP) required in Part I.C.
15. All existing manufacturing, commercial, mining, and silvicultural dischargers must notify the Director as soon as they know or have reason to believe:
 - a. That any activity has occurred or will occur which would result in the discharge, on a routine or frequent basis, of any toxic pollutant which is not limited in the permit, if that discharge will exceed the highest of the following "notification levels":
 - (1) One hundred micrograms per liter (100 ug/l);
 - (2) Two hundred micrograms per liter (200 ug/l) for acrolein and acrylonitrile; five hundred micrograms per liter (500 ug/l) for 2,4-dinitrophenol and for 2-methyl-4,6-dinitro-phenol; and one milligram per liter (1 mg/l) for antimony;
 - (3) Five (5) times the maximum concentration value reported for that pollutant in the permit application in accordance with 40 C.F.R. s122.21(g)(7); or
 - (4) Any other notification level established by the Director in accordance with 40 C.F.R. s122.44(f) and Rhode Island Regulations.
 - b. That any activity has occurred or will occur which would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant which is not limited in the permit, if that discharge will exceed the highest of the following "notification

levels":

- (1) Five hundred micrograms per liter (500 ug/l);
 - (2) One milligram per liter (1 mg/l) for antimony;
 - (3) Ten (10) times the maximum concentration value reported for that pollutant in the permit application in accordance with 40 C.F.R. s122.21(g)(7); or
 - (4) Any other notification level established by the Director in accordance with 40 C.F.R. s122.44(f) and Rhode Island Regulations.
- c. That they have begun or expect to begin to use or manufacture as an intermediate or final product or by-product any toxic pollutant which was not reported in the permit application.
16. This permit serves as the State's Water Quality Certificate for the discharges described herein.

B. OPERATION AND MAINTENANCE

1. All surface runoff from process or work areas at the facility shall be contained and diverted to the on-site oil/water separators. The on-site oil/water separators consist of a 8,000-gallon separator located in the Petroleum-based Fuels, Oils, or Lubricants (POL) Facility and a 25,000-gallon separator located in the infield area adjacent to aircraft ramp area. Process or work areas are defined for the purpose of this permit as all of those areas subject to spills and leaks of raw materials or products (i.e., secondary containment areas, fueling areas, aircraft parking apron, loading or unloading areas, yard areas, etc.).
2. The release of runoff from any secondary containment area or holding basin shall be controlled so that this discharge alone or in combination with any other sources of wastewater does not exceed the optimum design flow rate for the oil/water separators or cause violations of the effluent limitations specified in this permit.
3. All storm water accumulated in the secondary containment area(s) shall be discharged to the POL Facility oil/water separator as soon as practical after completion of the most recent storm event and after determining that the accumulated water is free of product or sheen. If a sheen is detected by visual observations, the area will be covered with oil absorbent blankets to collect petroleum product. After the sheen has been absorbed and the absorbent blankets have been removed, the draining process will begin. If the amount of petroleum product is such that professional clean-up action is required, then all the liquid from the containment area(s) shall be removed by a Rhode Island-licensed hazardous waste hauler and properly disposed of off-site. Any discharges of accumulated storm water shall not cause an exceedance of any permit limits.
4. The storm water collection and treatment system shall be operated and maintained in order to provide optimal treatment of the storm water prior to discharge to the receiving water.
5. The SWPPP in Part I.C. shall specifically address the adequacy of containment of leaks and spills in storage areas (from Drums, Additive Tanks, Petroleum Product Tanks, etc.), truck loading area(s), and fueling area(s). Adequate containment must exist at these locations so as to prevent untreated discharges from reaching any surface water.
6. A schedule for routinely monitoring and cleaning all oil/water separators for both sludge

and oil layers shall be specified in the SWPPP. In addition, the SWPPP shall identify procedures for insuring compliance with the permit during any cleaning or maintenance periods.

7. The permittee shall assure the proper management of solid and hazardous waste in accordance with regulations promulgated under the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act (RCRA) of 1978 (40 U.S.C. 6901 et seq.), or amendments thereto.

C. STORM WATER POLLUTION PREVENTION PLAN REQUIREMENTS

1. A Storm Water Pollution Prevention Plan (SWPPP) shall be maintained and implemented by the permittee. The SWPPP shall be prepared in accordance with good engineering practices and identify potential sources of pollutants, which may reasonably be expected to affect the quality of storm water discharges associated with industrial activity from the facility. In addition, the SWPPP shall describe and ensure the implementation of Best Management Practices (BMPs) which are to be used to reduce or eliminate the pollutants in storm water discharges associated with industrial activity at the facility and to assure compliance with the terms and conditions of this permit.
2. RIANG submitted a plan to the DEM on September 1, 2016 for the implementation of appropriate storm water controls at the vehicle maintenance/refueling facility (Building 3). RIANG must ensure that the installation of the source-specific storm water controls will be done in accordance with all Town of North Kingstown, State, and Quonset Development Corporation (QDC) requirements. The plan will be subject to DEM review, modification, and approval.
 - a. For the source-specific storm water controls at the vehicle maintenance/refueling facility, RIANG shall use the following minimum design elements (Note: If RIANG will infiltrate any of the storm water from the vehicle maintenance/refueling facility, they must follow all the below elements):
 - (1) Any storm water from the fuel dispensing and tank filling areas shall be treated using either a multi-chamber oil/water separator or acceptable proprietary device (minimum oil storage capacity of 500 gallons) that is preceded by at least one catch basin;
 - (2) Provide a roof over the fuel dispensing area with roof drainage directed away from the dispensing area;
 - (3) Elevate the fuel dispensing and tank filling areas to prevent storm water from running in and through them;
 - (4) Provide grooved concrete for the perimeter of the pad around the fuel dispensing area to be used to contain small spills.
 - b. One (1) year following the installation of the storm water controls as required in Part I.C.2, RIANG shall submit an amended SWPPP to the DEM that includes a description of the storm water controls at the vehicle maintenance/refueling facility and an updated site plan identifying the location of the storm water controls.
3. The SWPPP shall be signed by the permittee in accordance with §1.12 of the RIPDES regulations (See 250-RICR-150-10-1.12) and retained on-site. The SWPPP shall be made available upon request by the DEM.

4. If the SWPPP is reviewed by the DEM, the permittee may be notified at any time that the SWPPP does not meet one or more of the minimum requirements of this part. After such notification from the DEM, the permittee shall make changes to the SWPPP and shall submit a written certification that the requested changes have been made. Unless otherwise provided by the DEM, the permittee shall have thirty (30) days after such notification to make the necessary changes.
5. The permittee shall immediately amend the SWPPP whenever there is a change in design, construction, operation, or maintenance, which has a significant effect of the potential for the discharge of pollutants to the waters of the State; a release of reportable quantities of hazardous substances and oil; or if the SWPPP proves to be ineffective in achieving the general objectives of controlling pollutants in storm water discharges associated with industrial activity. Changes must be noted and then submitted to DEM within fourteen (14) days. Amendments to the SWPPP may be reviewed by DEM in the same manner as Part I.C.4. of this permit.
6. The SWPPP shall include, at a minimum, the following items:
 - a. Description of Potential Pollutant Sources. The SWPPP must provide a description of potential sources which may be reasonably expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. It must identify all activities and significant materials, which may potentially be significant pollutant sources. Each plan shall include:
 - (1) A legible site map with a suitable scale such as 1"=40', 1"=50', or 1"=100' that supports easy identification of the following items (If the drainage area(s) is/are very large, the on-site map scale must be no smaller than 1"=100'). At a minimum the site map must include but not be limited to the following:
 - i. boundaries of the property and the size of the property in acres;
 - ii. directions of storm water flow (e.g., use arrows to show which ways storm water will flow);
 - iii. locations of all surface water bodies, including wetlands, in the immediate vicinity of the facility indicating if any of the waters are impaired and, if so, whether the waters have TMDLs established on them or other water quality determination;
 - iv. the location and extent of significant structures and delineation of impervious surfaces;
 - v. locations of all stormwater control measures;
 - vi. location of stormwater conveyances including ditches, pipes, and swales;
 - vii. locations of storm water inlets and outfalls, with a unique identification code for each outfall (e.g., Outfall 001, 002), identify if the outfall will be used as a stormwater monitoring point, and an approximate outline of the area draining to each outfall;
 - viii. if applicable, locations of all municipal separate storm sewers

- (MS4s), where stormwater from the facility discharges to the MS4;
- ix. locations of potential pollutant sources and locations where significant materials are exposed to precipitation;
 - x. locations where major spills or leaks have occurred;
 - xi. location and description of non-storm water discharges;
 - xii. locations of the following activities where such activities are exposed to precipitation: fueling stations; vehicle and equipment maintenance and or cleaning areas; loading/unloading areas; locations used for the treatment, storage, or disposal of wastes; liquid storage tanks; processing and storage areas; access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; the location of transfer of substance in bulk; and machinery; and
 - xiii. location and source of runoff from adjacent property containing significant quantities of pollutants of concern to the facility.
- (2) General Location Map. Provide a topographic map showing the general location of the facility with enough detail to identify the location of the facility and the receiving waters within one mile of the facility.
 - (3) An estimate of the overall runoff coefficient for the site, determined by an acceptable method, such as, but not limited to, area weighting.
 - (4) Receiving Waters and Wetlands. The name of the nearest receiving water(s), including intermittent streams, the areal extent and description of wetland that may receive discharges from the facility, impairments and a list of pollutants causing impairments if applicable.
 - (5) Summary of Potential Pollutant Sources. The permittee must identify each separate area at the facility where industrial materials or activities are exposed to storm water and from which allowable non-stormwater discharges are released. Industrial materials or activities include, but are not limited to, material handling equipment or activities; industrial machinery; storage, cleaning, fueling and maintenance of vehicles and equipment storage; and raw materials, intermediate products, by-products, final products, or waste products. Material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product or waste product. For each, separate area identified, the description must include:
 - i. A list of the activities (e.g., material storage, loading, access areas equipment fueling and cleaning, cutting steel beams);
 - ii. A list of the associated pollutant(s) or pollutant parameter(s) (e.g., crankcase oil, iron, biochemical oxygen demand, pH, etc.) associated with each activity. The pollutant list must include all significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between

the time of five (5) years before this permit and the present;

- iii. Method of on-site storage or disposal;
 - iv. For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow and an estimate of the types of pollutants, which are likely to be present in the storm water discharge;
 - v. The permittee must clearly identify areas where potential spills and leaks, which can contribute pollutants to storm water discharges, can occur, and their accompanying drainage points. For areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility to be covered under this permit, the permittee must provide a list of significant spills and leaks of toxic or hazardous pollutants that occurred during the five (5) year period prior to this permit. The list must be updated if significant spills or leaks occur in exposed areas of the facility during the time the permittee are covered by the permit. Significant spills and leaks include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under CWA §311 (see 40 CFR 110.10 and 40 CFR 117.21) or section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements.
- (6) Salt Storage. The permittee must document the location of any storage piles containing salt and used for deicing or other commercial or industrial purposes.
 - (7) A summary of existing sampling data describing pollutants in storm water discharges from the facility.
- b. Storm Water Management Controls. The permittee must develop a description of storm water management controls appropriate for the facility and implement such controls. The appropriateness for implementing controls listed in the SWPPP must reflect identified potential sources of pollutants at the facility. The description of storm water management controls must address the following minimum components, including a schedule for implementing such controls:
- (1) *Pollution Prevention Team.* The SWPPP must identify a specific individual(s) within the facility organization as members of a team that are responsible for developing the SWPPP and assisting the facility manager in its implementation, maintenance, and revision. The SWPPP must clearly identify the responsibilities of each team member. The activities and responsibilities of the team must address all aspects of facility's SWPPP.
 - (2) *Risk Identification and Assessment/Material Inventory.* The SWPPP must assess the potential of various sources which contribute pollutants to storm water discharge associated with the industrial activity. The SWPPP must include an inventory of the types of materials handled. Each of the following must be evaluated for the reasonable potential for contributing

pollutants to runoff: loading and unloading operations, outdoor manufacturing or processing activities, significant dust or particulate generating processes, and on-site waste disposal practices. Factors to consider include the toxicity of chemicals; quantity of chemicals used, produced, or discharged; the likelihood of contact with storm water, and the history of significant leaks or spills of toxic or hazardous pollutants. Also, include in the inventory of exposed materials a description of the potential pollutant sources from the following activities: aircraft, runway, ground vehicle and equipment maintenance and cleaning; aircraft and runway deicing operations; and fire suppression foam testing operations. If the permittee uses deicing chemicals, the permittee must maintain a record of the monthly quantities used.

- (3) *Preventative Maintenance.* A preventative maintenance program must involve inspection and maintenance of storm water management devices (i.e., oil/water separators, catch basins) as well as inspecting and testing plant equipment and systems to uncover conditions that could cause breakdown or failures resulting in discharges of pollutants to surface waters.
- (4) *Minimizing Exposure.* Where practicable, industrial materials and activities should be protected by a storm-resistant shelter to prevent exposure to rain, snow, snowmelt, or runoff.
- (5) *Good Housekeeping.* Good housekeeping requires the maintenance of a clean, orderly facility. If applicable, the following areas must be specifically addressed:
 - i. Aircraft, Vehicle, and Equipment Storage Areas: The storage of aircraft, vehicles and equipment with actual or potential fluid leaks must be confined to designated areas (delineated on the site map). The SWPPP must describe measures that prevent or minimize contamination of the storm water runoff from these areas. The facility shall consider the use of drip pans under aircraft/vehicles/equipment, indoor storage of the aircraft/vehicles/equipment, installation of berming and diking of this area, use of absorbents, roofing or covering storage areas, cleaning pavement surface to remove oil and grease, or other equivalent methods.
 - ii. Fueling Areas: The SWPPP must describe measures that prevent or minimize contamination of the storm water runoff from fueling areas. The facility shall consider berming the fueling area(s), using spill and overflow protection and cleanup equipment, minimizing run-on/runoff of storm water to the fueling area(s) by way of storm water drains, using dry cleanup methods, collecting the storm water runoff and providing treatment or recycling, or other equivalent measures.
 - iii. Material Storage Areas: Storage units of all materials (e.g., used oil, used oil filters, spent solvents, paint wastes, radiator fluids, transmission fluids, hydraulic fluids) must be maintained in good condition, so as to prevent contamination of storm water, and plainly labeled (e.g., "used oil", "spent solvents", etc.). The SWPPP must describe measures that prevent or minimize

contamination of the storm water runoff from such storage areas. The facility shall consider indoor storage of the materials, storing waste materials in a centralized location, installation of berming and diking of the area, minimizing run-on/runoff of storm water to the areas, using dry cleanup methods, collecting the storm water runoff and providing treatment, or other equivalent methods.

- iv. Aircraft, Vehicle, and Equipment Cleaning Areas: The SWPPP must describe measures that prevent the discharge of aircraft/vehicle/equipment wash waters, including tank-cleaning operations, and engine compressor washes of C-130J aircraft. The facility shall consider performing all cleaning operations indoors, covering the cleaning operation, ensuring that all washwaters drain to the intended collection system, collecting the storm water runoff from the cleaning area and providing treatment or recycling, or other equivalent measures. These discharges are not authorized by this permit, except for the clear water rinses of C-130J aircraft as described in Part I.A.14.
- v. Aircraft, Vehicle, and Equipment Maintenance Areas: The SWPPP must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for aircraft/vehicle/equipment maintenance (including the maintenance conducted on the aircraft in dedicated hangars). The facility shall consider performing all maintenance activities indoors, using drip pans, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting wet cleanup practices where the practices would result in the discharge of pollutants to storm water drainage systems, using dry cleanup methods, collecting the storm water runoff from the maintenance area and providing treatment or recycling, minimizing run-on/runoff of storm water areas or other equivalent measures.
- vi. Source Reduction: Consider alternatives to the use of glycol-based deicing chemicals to reduce the aggregate amount of deicing chemicals used and/or lessen the environmental impact.
 - a) *Runway Deicing Operation*: Evaluate at a minimum whether over-application of deicing chemicals occurs by analyzing application rates and adjusting as necessary, consistent with considerations of flight safety. Also consider these BMP options (or their equivalents): metered application of chemicals; pre-wetting dry chemical constituents prior to application; installing a runway ice detection system; implementing anti-icing operations as a preventive measure against ice build-up.
 - b) *Aircraft Deicing Operations*: Determine whether excessive application of deicing chemicals occurs and adjust as necessary, consistent with considerations of flight safety. This evaluation must be carried out by the personnel most familiar with the particular aircraft and flight operations in question (versus an outside entity such as the airport authority). Consider using alternative

deicing/anti-icing agents as well as containment measures for all applied chemicals. Also, consider these BMP options (or their equivalents) for reducing deicing fluid use: forced-air deicing systems, computer-controlled fixed-gantry systems, infrared technology, hot water, varying glycol content to air temperature, enclosed-basket deicing trucks, mechanical methods, solar radiation, hangar storage, aircraft covers, etc. Also consider using ice-detention systems and airport traffic flow strategies and departure slot allocation systems (if applicable).

- vii. Management of Runoff: Where deicing operations occur, describe and implement a program to control or manage contaminated runoff to reduce the amount of pollutants being discharged from the site. The program must include a discussion of the aircraft parking apron deicing pad and glycol recovery system, which includes a dedicated deicing area, diversion manhole, two-way valve structure, and 25,000-gallon collection tank. Also, consider recovering deicing materials when these materials are applied during non-precipitation events (e.g., covering storm sewer inlets, using booms, installing absorptive interceptors in the drains, etc.) to prevent these materials from later becoming a source of storm water contamination. Used deicing fluid should be recycled whenever possible.
- (6) *Spill Prevention and Response Procedure*. Areas where potential spills can occur, and their accompanying drainage points, must be identified clearly in the SWPPP. The potential for spills to enter the storm water drainage system must be eliminated wherever feasible. Where appropriate, specific material handling procedures, storage requirements, and procedures for cleaning up spills must be identified in the SWPPP and made available to the appropriate personnel. The necessary equipment to implement a clean-up must also be made available to personnel. The permittee shall immediately notify the office of releases in excess of reportable quantities.
- (7) *Storm Water Management*. The SWPPP must contain a narrative consideration of the appropriateness of traditional storm water management practices. Based on an assessment of the potential of various sources at the plant to contribute pollutants to storm water discharges associated with industrial activity (see Part I.C.6.b.2 of this permit), the SWPPP must provide that measures, determined to be reasonable and appropriate, must be implemented and maintained.
- (8) *Sediment and Erosion Prevention*. The SWPPP must identify areas which; due to topography, activities, or other factors; have a high potential for significant soil erosion and identify measures to limit erosion.
- (9) *Employee Training*. Employee training programs must inform personnel responsible for implementing activities identified in the SWPPP, or otherwise responsible for storm water management at all levels, of the components and goals of the SWPPP. Training should address topics such as spill response, good housekeeping, and material management practices. The SWPPP must identify periodic dates for such training.

- (10) *Disposal Procedures.* The disposal procedures for tank bottom waters, tank bottom sludge, oil/water separator sediments, oil/water separator oils, oil absorbent cleaning material(s) and any washdown waters containing detergents, dispersants, emulsifiers, etc. must be documented in the SWPPP.
 - (11) *Routine Facility Inspections.* Qualified plant personnel must be identified to inspect the following areas of the facility: areas where industrial materials or activities are exposed to stormwater; areas identified in the SWPPP and those that are potential pollutant sources; areas where spills or leaks have occurred in the past three (3) years; and stormwater control measures used to comply with the effluent limits contained in this permit. Material handling areas must be inspected for evidence of, or the potential for, pollutants entering the drainage system. A tracking or follow up procedure must be used to ensure that the appropriate action has been taken in response to the inspection. Records of inspections must be maintained on site for at least five (5) years. Routine facility inspections must be conducted quarterly and with at least one member of the facility's stormwater pollution prevention team participating. At a minimum, the permittee must conduct monthly inspections during all months in which deicing chemicals may be used in the areas where deicing/anti-icing occurs and has the potential to enter the storm water collection system. Also, if significantly or deleteriously large quantities of deicing chemicals are being spilled or discharged, or if water quality impacts have been reported, increase the frequency of the inspections to weekly until such time as the chemical spills/discharges or impacts are reduced to acceptable levels. The DEM may specifically require the permittee to increase inspections and SWPPP reevaluations as necessary.
 - (12) *Recordkeeping and Internal Reporting Procedures.* Incidents such as spills, or other discharges, along with other information describing the quality and quantity of storm water discharges must be included in the records. All inspections and maintenance activities must be documented and maintained on site for at least five (5) years.
- c. Deicing Fluid Collection and Management. A description of equipment and operation and management procedures related to deicing fluid usage and collection. The permittee shall implement a glycol recovery program that includes the following minimum components:
- (1) *Collection Program Operating Procedures.* Standard operating procedures and overall glycol recovery goals for the collection program, including at a minimum, the following:
 - i. Overall collection efficiency goals for glycol collection program;
 - ii. Dry weather (if applicable) and wet weather operating procedures;
 - iii. Management and description of glycol storage tanks, aircraft deicing pad, and glycol recovery tank;
 - iv. Recordkeeping forms and procedures;
 - v. Training program for glycol collection personnel.
 - (2) *Annual Deicing Fluid Collection and Management Report.* An annual

report must be prepared which provides a summary and description of glycol usage, collection and management activities during the previous deicing season. Such report shall be submitted to the DEM with the Annual Site Inspection Reports required under Part I.C.6.g. no later than July 15th of each year and must include, at a minimum, the following:

- i. Tabular summary of aircraft deicing fluid usage and collection volumes (total glycol used and collected per day that deicing occurs, and total glycol used and collected annually);
 - ii. Summary of overall seasonal weather conditions;
 - iii. A summary of each event specific report that includes a discussion of types and timing of storms and resulting effect(s) on collection activities for each individual storm event;
 - iv. A summary of all odor complaints received and any investigations and related amendments to the SWPPP and associated BMPs;
 - vi. Recommendations for usage and collection procedures, and equipment to improve collection efficiencies and overall program management, enhanced BMPs and recommendations to amend the SWPPP. The recommendations must include a schedule to amend the SWPPP and implement enhanced BMPs subject to the Director's approval.
- d. Fertilizer and Pesticide Management. The permittee shall develop and implement BMPs for fertilizer and pesticide management with the goal of reducing or eliminating the concentrations and loads of fertilizers and pesticides in storm water discharges to the receiving waters. Mosquito control products shall be employed in accordance with State requirements by qualified personnel.
- e. Post-Construction Storm Water Management in New Development and Redevelopment. The permittee shall develop and implement a program to address storm water runoff from new development and redevelopment projects. The plan must address direct discharges of storm water to waters of the State in addition to the discharges to the storm drainage system. The program must ensure that controls are in place to prevent or minimize water quality impacts. The post-construction program must include:
- (1) Development and implementation of strategies which include a combination of structural methods such as detention basins, wet basins, infiltration basins and trenches, dry wells, galleys, vegetated swales and vegetated filter strips and/or non-structural BMPs.
 - (2) Procedures for site plan review to ensure that design of controls to address post-construction runoff are consistent with: The State of Rhode Island Storm Water Design and Installation Manual (as amended).
 - (3) Procedures to ensure adequate and long-term operation and maintenance of BMPs.
 - (4) Procedures to develop and implement strategies to reduce runoff volume which may include minimizing impervious areas such as roads, parking, paving or other surfaces, encouraging infiltration of non-contaminated runoff, preventing channelization, encouraging sheet flow, and where appropriate, preserving, enhancing or establishing buffers along surface water bodies and

tributaries.

f. Non-Storm Water Discharges.

(1) *Certification of Non-Storm Water Discharges.* The SWPPP must include a certification that all discharges (i.e., outfalls) have been tested or evaluated for the presence of non-storm water. The certification must be signed in accordance with §1.12 of the RIPDES regulations (See 250-RICR-150-10-1.12) and include the following:

- i. The date of any testing and/or evaluation;
- ii. Identification of potential significant sources of non-storm water at the site;
- iii. A description of the results of any test and/or evaluation for the presence of non-storm water discharges;
- iv. A description of the evaluation criteria or testing method used;
- v. A list of the outfalls or onsite drainage points that were directly observed during the test; and
- vi. The action(s) taken, such as a list of control measures used to eliminate unauthorized discharge(s). For example, a floor drain was sealed, a sink drain was re-routed to the sanitary sewer.

A copy of the notification must be included in the SWPPP at the facility. Non-storm water discharges to waters of the State that are not authorized by a RIPDES permit are unlawful and must be terminated.

(2) *Allowable Non-Storm Water Discharges.* Certain sources of non-storm water are allowable under Part I.A.14 of this permit. In order for these discharges to be allowed, the SWPPP must include the following:

- i. identification of each allowable non-storm water source;
- ii. the location where it is likely to be discharged; and
- iii. descriptions of appropriate BMPs for each source.

Except for flows from firefighting activities, the permittee must identify in the SWPPP all sources of allowable non-storm water that are discharged under the authority of this permit. If the permittee includes mist blown from cooling towers amongst the allowable non-storm water discharges, the permittee must specifically evaluate the potential for the discharges to be contaminated by chemicals used in the cooling tower and determine that the levels of such chemicals in the discharges would not cause or contribute to a violation of an applicable water quality standard after implementation of the BMPs the permittee has selected to control such discharges.

g. Annual Site Inspection Report. An annual site inspection must be conducted by appropriate personnel named in the SWPPP to verify that the description of potential pollutant sources required under Part I.C.6.a is accurate, that the

drainage map has been updated or otherwise modified to reflect current conditions, and controls to reduce pollutants in storm water discharges associated with industrial activity identified in the SWPPP are being implemented and are adequate. If possible, the annual site inspection should be conducted during a period of actual deicing operations. If not practicable during active deicing or the weather is too inclement, conduct the evaluations when deicing operations are likely to occur and the materials and equipment for deicing are in place. The following areas shall be included in all inspections: aircraft and runway deicing areas, storage areas for aircraft/vehicles/equipment awaiting maintenance, fueling area(s), aircraft/vehicle/equipment maintenance areas (both indoors and outdoors), material storage areas, aircraft/vehicle/equipment cleaning areas, loading and unloading areas, and storm water discharge location and receiving water. A tracking or follow up procedure must be used to ensure that the appropriate action has been taken in response to the inspection. A copy of the annual site inspection report and records documenting significant observations made during the site inspection must be submitted to the DEM by July 15th for the previous twelve (12) month period (July 1 – June 30). A copy of the annual site inspection report must also be retained as part of the SWPPP for a minimum of five (5) years.

- h. Consistency with Other Plans. Storm water management controls may reflect requirements for Spill Prevention Control and Countermeasure (SPCC) plans under Section 311 of the CWA or Best Management Practices (BMP) Programs otherwise required by a RIPDES permit and may incorporate any part of such plans into the SWPPP by reference.

D. DETECTION LIMITS

All analyses of parameters under this permit must comply with the National Pollutant Discharge Elimination System (NPDES): Use of Sufficiently Sensitive Test Methods for Permit Applications and Reporting rule. Only sufficiently sensitive test methods may be used for analyses of parameters under this permit. The permittee shall assure that all testing required by this permit, is performed in conformance with methods listed in 40 CFR 136. In accordance with 40 CFR 136, EPA approved analysis techniques, quality assurance procedures and quality control procedures shall be followed for all reports required to be submitted under the Rhode Island Pollutant Discharge Elimination System (RIPDES) program. These procedures are described in "Methods for the Determination of Metals in Environmental Samples" (EPA/600/4-91/010) and "Methods for Chemical Analysis of Water and Wastes" (EPA/600/4-79/020).

If after conducting the complete Method of Standard Additions analysis, the laboratory is unable to determine a valid result, the laboratory shall report "could not be analyzed". Documentation supporting this claim shall be submitted along with the monitoring report. If valid analytical results are repeatedly unobtainable, DEM may require that the permittee determine a method detection limit (MDL) for their effluent or sludge as outlined in 40 CFR 136, Appendix B.

When calculating sample averages for reporting on discharge monitoring reports (DMRs):

1. "could not be analyzed" data shall be excluded, and shall not be considered as failure to comply with the permit sampling requirements;
2. results reported as less than the MDL shall be included as zeros in accordance with the DEM's DMR Instructions, provided that all appropriate EPA approved methods were followed.

Therefore, all sample results shall be reported as: an actual value, "could not be analyzed", or zero. The effluent or sludge specific MDL must be calculated using the methods outlined in 40 CFR 136, Appendix B. Samples which have been diluted to ensure that the sample concentration will be within the linear dynamic range shall not be diluted to the extent that the analyte is not detected. If this should occur the analysis shall be repeated using a lower degree of dilution.

LIST OF TOXIC POLLUTANTS

The following list of toxic pollutants has been designated pursuant to Section 307(a)(1) of the Clean Water Act. The Method Detection Limits (MDLs) represent the required Rhode Island MDLs.

Volatiles - EPA Method 624		MDL ug/l (ppb)	Pesticides - EPA Method 608		MDL ug/l (ppb)
1V	acrolein	10.0	18P	PCB-1242	0.289
2V	acrylonitrile	5.0	19P	PCB-1254	0.298
3V	benzene	1.0	20P	PCB-1221	0.723

* Polynuclear Aromatic Hydrocarbons

** No Rhode Island Department of Environmental Management (RIDEM) MDL

*** Not a priority pollutant as designated in the 1997 Water Quality Regulations (Table 5)

NOTE:

The MDL for a given analyte may vary with the type of sample. MDLs which are determined in reagent water may be lower than those determined in wastewater due to fewer matrix interferences. Wastewater is variable in composition and may therefore contain substances (interferents) that could affect MDLs for some analytes of interest. Variability in instrument performance can also lead to inconsistencies in determinations of MDLs.

E. MONITORING AND REPORTING

1. Monitoring

All monitoring required by this permit shall be done in accordance with sampling and analytical testing procedures specified in Federal Regulations (40 CFR Part 136).

2. Submittal of DMRs Using NetDMR

Monitoring results obtained during the previous three (3) months shall be summarized and reported to DEM in discharge monitoring reports (DMRs) submitted electronically using the NetDMR reporting tool (<https://netdmr.epa.gov>). When the permittee submits DMRs using NetDMR, it is not required to submit hard copies of DMRs to DEM.

The first report is due for the calendar quarter during which the facility obtained coverage under this permit. Testing shall be reported as follows:

<u>Quarter Testing to be Performed</u>	<u>Report Due No Later Than</u>	<u>Results Submitted with DMR for</u>
January 1 – March 31	April 15	March
April 1 – June 30	July 15	June
July 1 – September 30	October 15	September
October 1 - December 31	January 15	December

3. Submittal of Reports as NetDMR Attachments

Unless otherwise specified in this permit, the permittee must submit electronic copies of documents in NetDMR that are directly related to the DMR. These include the following:

- DMR Cover Letters
- Below Detection Limit summary tables
- Storm event information per Part I.E.6 of the permit
- Storm water sampling waiver per Part I.E.7 of the permit

All other reports should be submitted to DEM as a hard copy via regular US mail (see Part I.E.4 below).

4. Submittal of Requests and Reports to DEM

The following requests, reports, and information described in this permit shall be submitted as hard copy to the DEM.

- a. Transfer of Permit notice;
- b. Request for changes in sampling location;
- c. Request for reduction in testing frequency;
- d. Request to add chemicals or “bioremedial agents including microbes” to the collection and treatment system per Part I.A.4 of the permit;
- e. Written notifications required under Part II;
- f. Notice of unauthorized discharges;
- g. Amendments to the SWPPP per Parts I.C.2.b, I.C.4, and I.C.5 of the permit;
- h. Annual Deicing Fluid Collection and Management Report per Part I.C.6.c of the permit;
- i. Annual Site Inspection Report per Part I.C.6.g of the permit.

These reports, information, and requests shall be submitted to DEM by hard copy mail to

the following address:

Rhode Island Department of Environmental Management
RIPDES Program
235 Promenade Street
Providence, RI 02908

5. Verbal Reports and Verbal Notifications

Any verbal reports or verbal notifications, if required in Parts I and/or II of this permit, shall be made to the DEM. This includes verbal reports and notifications required under Part II.(1)(5) General Requirements. Verbal reports and verbal notifications shall be made to DEM at (401) 222-4700 or (401) 222-3070 at night.

6. In addition to the required sampling results submitted in accordance with Part I.A.1., and I.A.2. of this permit, the permittee must provide the date and duration (hours) of the storm events sampled, the total depth of rainfall (inches), and the total volume of runoff (Ft³). This information must be submitted with the Discharge Monitoring Report forms at the frequency specified in Part I.E.2 of this permit.

7. If the permittee is unable to collect samples due to adverse climatic conditions which make the collection of samples dangerous or impractical, the permittee must submit, in lieu of sampling data, a description of why samples could not be collected, including available precipitation data for the monitoring period. The permittee can only exercise this waiver once in a two (2) year period for the outfall designated 100. A waiver is not required if there was no flow from the outfall for the reporting period. This information must be submitted with the Discharge Monitoring Report form for the period in which a sampling waiver is being requested.

PART II
TABLE OF CONTENTS

GENERAL REQUIREMENTS

- (a) Duty to Comply
- (b) Duty to Reapply
- (c) Need to Halt or Reduce Not a Defense
- (d) Duty to Mitigate
- (e) Proper Operation and Maintenance
- (f) Permit Actions
- (g) Property Rights
- (h) Duty to Provide Information
- (i) Inspection and Entry
- (j) Monitoring and Records
- (k) Signatory Requirements
- (l) Reporting Requirements
- (m) Bypass
- (n) Upset
- (o) Change in Discharge
- (p) Removed Substances
- (q) Power Failures
- (r) Availability of Reports
- (s) State Laws
- (t) Other Laws
- (u) Severability
- (v) Reopener Clause
- (w) Confidentiality of Information
- (x) Best Management Practices
- (y) Right of Appeal

DEFINITIONS

GENERAL REQUIREMENTS

(a) Duty to Comply

The permittee must comply with all conditions of this permit. Any permit noncompliance constitutes a violation of Chapter 46-12 of the Rhode Island General Laws and the Clean Water Act (CWA) and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.

- (1) The permittee shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if the permit has not yet been modified to incorporate the requirement.
- (2) The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the CWA is subject to a civil penalty not to exceed \$10,000 per day of such violation. Any person who willfully or negligently violates permit conditions implementing Sections 301, 302, 306, 307 or 308 of the Act is subject to a fine of not less than \$2,500 nor more than \$25,000 per day of violation, or by imprisonment of not more than 1 year, or both.
- (3) Chapter 46-12 of the Rhode Island General Laws provides that any person who violates a permit condition is subject to a civil penalty of not more than \$5,000 per day of such violation. Any person who willfully or negligently violates a permit condition is subject to a criminal penalty of not more than \$10,000 per day of such violation and imprisonment for not more than 30 days, or both. Any person who knowingly makes any false statement in connection with the permit is subject to a criminal penalty of not more than \$5,000 for each instance of violation or by imprisonment for not more than 30 days, or both.

(b) Duty to Reapply

If the permittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the permittee must apply for and obtain a new permit. The permittee shall submit a new application at least 180 days before the expiration date of the existing permit, unless permission for a later date has been granted by the Director. (The Director shall not grant permission for applications to be submitted later than the expiration date of the existing permit.)

(c) Need to Halt or Reduce Not a Defense

It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

(d) Duty to Mitigate

The permittee shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

(e) Proper Operation and Maintenance

The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures, and, where applicable, compliance with DEM "Rules and Regulations Pertaining to the Operation and Maintenance of Wastewater Treatment Facilities" and "Rules and Regulations Pertaining to the Disposal and Utilization of Wastewater Treatment Facility Sludge." This provision requires the operation of back-up or auxiliary facilities or similar systems only when the operation is necessary to achieve compliance with the conditions of the permit.

(f) Permit Actions

This permit may be modified, revoked and reissued, or terminated for cause, including but not limited to: (1) Violation of any terms or conditions of this permit; (2) Obtaining this permit by misrepresentation or failure to disclose all relevant facts; or (3) A change in any conditions that requires either a temporary or permanent reduction or elimination of the authorized discharge. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination or a notification of planned changes or anticipated noncompliance, does not stay any permit condition.

(g) Property Rights

This permit does not convey any property rights of any sort, or any exclusive privilege.

(h) Duty to Provide Information

The permittee shall furnish to the Director, within a reasonable time, any information which the Director may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit, or to determine compliance with this permit. The permittee shall also furnish to the Director, upon request, copies of records required to be kept by this permit.

(i) Inspection and Entry

The permittee shall allow the Director, or an authorized representative, upon the presentation of credentials and other documents as may be required by law, to:

- (1) Enter upon the permittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this permit;
- (2) Have access to and copy, at reasonable times any records that must be kept under the conditions of this permit;
- (3) Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices or operations regulated or required under this permit; and

- (4) Sample or monitor any substances or parameters at any location, at reasonable times, for the purposes of assuring permit compliance or as otherwise authorized by the CWA or Rhode Island law.

(j) Monitoring and Records

- (1) Samples and measurements taken for the purpose of monitoring shall be representative of the volume and nature of the discharge over the sampling and reporting period.
- (2) The permittee shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings from continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 5 years from the date of the sample, measurement, report or application. This period may be extended by request of the Director at any time.
- (3) Records of monitoring information shall include:
 - (i) The date, exact place, and time of sampling or measurements;
 - (ii) The individual(s) who performed the sampling or measurements;
 - (iii) The date(s) analyses were performed;
 - (iv) The individual(s) who performed the analyses;
 - (v) The analytical techniques or methods used; and
 - (vi) The results of such analyses.
- (4) Monitoring must be conducted according to test procedures approved under 40 CFR Part 136 and applicable Rhode Island regulations, unless other test procedures have been specified in this permit.
- (5) The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate, any monitoring device or method required to be maintained under this permit shall upon conviction, be punished by a fine of not more than \$10,000 per violation or by imprisonment for not more than 6 months per violation or by both. Chapter 46-12 of the Rhode Island General Laws also provides that such acts are subject to a fine of not more than \$5,000 per violation, or by imprisonment for not more than 30 days per violation, or by both.
- (6) Monitoring results must be reported on a Discharge Monitoring Report (DMR).
- (7) If the permittee monitors any pollutant more frequently than required by the permit, using test procedures approved under 40 CFR Part 136, applicable State regulations, or as specified in the permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR.

(k) Signatory Requirement

All applications, reports, or information submitted to the Director shall be signed and certified in accordance with 250-RICR-150-10-1.12 of the Rhode Island Pollutant Discharge Elimination System (RIPDES) Regulations. Rhode Island General Laws, Chapter 46-12 provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than \$5,000 per violation, or by imprisonment for not more than 30 days per violation, or by both.

(l) Reporting Requirements

- (1) Planned changes. The permittee shall give notice to the Director as soon as possible of any planned physical alterations or additions to the permitted facility.
- (2) Anticipated noncompliance. The permittee shall give advance notice to the Director of any planned changes in the permitted facility or activity which may result in noncompliance with the permit requirements.
- (3) Transfers. This permit is not transferable to any person except after written notice to the Director. The Director may require modification or revocation and reissuance of the permit to change the name of the permittee and incorporate such other requirements as may be necessary under State and Federal law.
- (4) Monitoring reports. Monitoring results shall be reported at the intervals specified elsewhere in this permit.
- (5) Twenty-four hour reporting. The permittee shall immediately report any noncompliance which may endanger health or the environment by calling DEM at (401) 222-4700 or (401) 222-3070 at night.

A written submission shall also be provided within five (5) days of the time the permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

The following information must be reported immediately:

- (i) Any unanticipated bypass which causes a violation of any effluent limitation in the permit; or
- (ii) Any upset which causes a violation of any effluent limitation in the permit; or
- (iii) Any violation of a maximum daily discharge limitation for any of the pollutants specifically listed by the Director in the permit.

The Director may waive the written report on a case-by-case basis if the oral report has been received within 24 hours.

- (6) Other noncompliance. The permittee shall report all instances of noncompliance not reported under paragraphs (1), (2), and (5), of this section, at the time monitoring reports are submitted. The reports shall contain the information required in paragraph (l)(5) of the section.
- (7) Other information. Where the permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Director, they shall promptly submit such facts or information.

(m) Bypass

"Bypass" means the intentional diversion of waste streams from any portion of a treatment facility.

- (1) Bypass not exceeding limitations. The permittee may allow any bypass to occur which does not cause effluent limitations to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions of paragraphs (2) and (3) of this section.
- (2) Notice.
 - (i) Anticipated bypass. If the permittee knows in advance of the need for a bypass, it shall submit prior notice, if possible at least ten (10) days before the date of the bypass.
 - (ii) Unanticipated bypass. The permittee shall submit notice of an unanticipated bypass as required in 250-RICR-150-10-1.14(R) of the RIPDES Regulations.
- (3) Prohibition of bypass.
 - (i) Bypass is prohibited, and the Director may take enforcement action against a permittee for bypass, unless:
 - (A) Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage, where "severe property damage" means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production;
 - (B) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate backup equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; and
 - (C) The permittee submitted notices as required under paragraph (2) of this section.

- (ii) The Director may approve an anticipated bypass, after considering its adverse effects, if the Director determines that it will meet the three conditions listed above in paragraph (3)(i) of this section.

(n) Upset

"Upset" means an exceptional incident in which there is unintentional and temporary noncompliance with technology-based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

- (1) Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology-based permit effluent limitations if the requirements of paragraph (2) of this section are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review.
- (2) Conditions necessary for a demonstration of upset. A permittee who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:
 - (a) An upset occurred and that the permittee can identify the cause(s) of the upset;
 - (b) The permitted facility was at the time being properly operated;
 - (c) The permittee submitted notice of the upset as required in 250-RICR-150-10-1.14(R) of the RIPDES Regulations; and
 - (d) The permittee complied with any remedial measures required under 250-RICR-150-10-1.14(E) of the RIPDES Regulations.
- (3) Burden of proof. In any enforcement proceeding the permittee seeking to establish the occurrence of an upset has the burden of proof.

(o) Change in Discharge

All discharges authorized herein shall be consistent with the terms and conditions of this permit. Discharges which cause a violation of water quality standards are prohibited. The discharge of any pollutant identified in this permit more frequently than or at a level in excess of that authorized shall constitute a violation of the permit. Any anticipated facility expansions, production increases, or process modifications which will result in new, different or increased discharges of pollutants must be reported by submission of a new NPDES application at least 180 days prior to commencement of such discharges, or if such changes will not violate the effluent limitations specified in this permit, by notice, in writing, to the Director of such changes. Following such notice, the permit may be modified to specify and limit any pollutants not previously limited.

Until such modification is effective, any new or increased discharge in excess of permit limits or not specifically authorized by the permit constitutes a violation.

(p) Removed Substances

Solids, sludges, filter backwash, or other pollutants removed in the course of treatment or control of wastewaters shall be disposed of in a manner consistent with applicable Federal and State laws and regulations including, but not limited to the CWA and the Federal Resource Conservation and Recovery Act, 42 U.S.C. §§6901 et seq., Rhode Island General Laws, Chapters 46-12, 23-19.1 and regulations promulgated thereunder.

(q) Power Failures

In order to maintain compliance with the effluent limitation and prohibitions of this permit, the permittee shall either:

In accordance with the Schedule of Compliance contained in Part I, provide an alternative power source sufficient to operate the wastewater control facilities;

or if such alternative power source is not in existence, and no date for its implementation appears in Part I,

Halt reduce or otherwise control production and/or all discharges upon the reduction, loss, or failure of the primary source of power to the wastewater control facilities.

(r) Availability of Reports

Except for data determined to be confidential under paragraph (w) below, all reports prepared in accordance with the terms of this permit shall be available for public inspection at the DEM, 235 Promenade Street, Providence, Rhode Island 02908. As required by the CWA, effluent data shall not be considered confidential. Knowingly making any false statement on any such report may result in the imposition of criminal penalties as provided for in Section 309 of the CWA and under Section 46-12-14 of the Rhode Island General Laws.

(s) State Laws

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law.

(t) Other Laws

The issuance of a permit does not authorize any injury to persons or property or invasion of other private rights, nor does it relieve the permittee of its obligation to comply with any other applicable Federal, State, and local laws and regulations.

(u) Severability

The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit, shall not be affected thereby.

(v) Reopener Clause

The Director reserves the right to make appropriate revisions to this permit in order to incorporate any appropriate effluent limitations, schedules of compliance, or other provisions which may be authorized under the CWA or State law. In accordance with 250-RICR-150-10-1.16 and 250-RICR-150-10-1.24 of the RIPDES Regulations, if any effluent standard or prohibition, or water quality standard is promulgated under the CWA or under State law which is more stringent than any limitation on the pollutant in the permit, or controls a pollutant not limited in the permit, then the Director may promptly reopen the permit and modify or revoke and reissue the permit to conform to the applicable standard.

(w) Confidentiality of Information

(1) Any information submitted to DEM pursuant to these regulations may be claimed as confidential by the submitter. Any such claim must be asserted at the time of submission in the manner prescribed on the application form or instructions or, in the case of other submissions, by stamping the words "confidential business information" on each page containing such information. If no claim is made at the time of submission, DEM may make the information available to the public without further notice.

(2) Claims of confidentiality for the following information will be denied:

- (i) The name and address of any permit applicant or permittee;
- (ii) Permit applications, permits and any attachments thereto; and
- (iii) NPDES effluent data.

(x) Best Management Practices

The permittee shall adopt Best Management Practices (BMP) to control or abate the discharge of toxic pollutants and hazardous substances associated with or ancillary to the industrial manufacturing or treatment process and the Director may request the submission of a BMP plan where the Director determines that a permittee's practices may contribute significant amounts of such pollutants to waters of the State.

(y) Right of Appeal

Within thirty (30) days of receipt of notice of a final permit decision, the permittee or any interested person may submit a request to the Director for an adjudicatory hearing to reconsider or contest that decision. The request for a hearing must conform to the requirements of 250-RICR-150-10-1.50 of the RIPDES Regulations.

DEFINITIONS

1. For purposes of this permit, those definitions contained in the RIPDES Regulations and the Rhode Island Pretreatment Regulations shall apply.
2. The following abbreviations, when used, are defined below.

cu. M/day or M ³ /day	cubic meters per day
mg/l	milligrams per liter
ug/l	micrograms per liter
lbs/day	pounds per day
kg/day	kilograms per day
Temp. °C	temperature in degrees Centigrade
Temp. °F	temperature in degrees Fahrenheit
Turb.	turbidity measured by the Nephelometric Method (NTU)
TNFR or TSS	total nonfilterable residue or total suspended solids
DO	dissolved oxygen
BOD	five-day biochemical oxygen demand unless otherwise specified
TKN	total Kjeldahl nitrogen as nitrogen
Total N	total nitrogen
NH ₃ -N	ammonia nitrogen as nitrogen
Total P	total phosphorus
COD	chemical oxygen demand
TOC	total organic carbon
Surfactant	surface-active agent
pH	a measure of the hydrogen ion concentration
PCB	polychlorinated biphenyl
CFS	cubic feet per second
MGD	million gallons per day
Oil & Grease	Freon extractable material
Total Coliform	total coliform bacteria
Fecal Coliform	total fecal coliform bacteria
ml/l	milliliter(s) per liter
NO ₃ -N	nitrate nitrogen as nitrogen
NO ₂ -N	nitrite nitrogen as nitrogen
NO ₃ -NO ₂	combined nitrate and nitrite nitrogen as nitrogen
Cl ₂	total residual chlorine

I. Proposed Action, Type of Facility, and Discharge Location

The above-named applicant has applied to the Rhode Island Department of Environmental Management (DEM) for reissuance of a RIPDES Permit to discharge into the designated receiving water. The applicant's discharge consists of storm water runoff associated with industrial activity at Rhode Island Air National Guard's base. The discharge is to Frys Pond.

II. Description of Discharge

The Rhode Island Air National Guard (RIANG) 143rd Airlift Wing (143 AW) operates the facility located at the Quonset State Airport in North Kingstown, RI. The facility (referred to as the "Base") provides support for the 143 AW, which flies and maintains C-130J aircraft to support its airlift mission. This permit authorizes storm water and allowable non-storm water point source discharges as defined in the Permit to Frys Pond from RIANG's storm water collection system. For the purposes of this permit, storm water includes storm water runoff and snowmelt runoff. There is no limit on the time between the snowfall and snowmelt for the purpose of including a snowmelt discharge in the definition of storm water. Allowable non-storm water discharges are limited to those that are consistent with DEM's 2019 Multi-Sector General Permit. A listing of allowable non-storm water discharges can be found below in Section IV of the Statement off Basis under Prohibited Discharges / Non-storm Water Discharges and must be identified in the facility's SWPPP. Any other discharges are not authorized under this permit. The conditions in this permit apply to all Base personnel and contractors/vendors engaged in servicing, repairing, or maintaining aircraft and ground vehicles, equipment cleaning and maintenance (including vehicle and equipment rehabilitation, mechanical repairs, painting, fueling, lubrication), or deicing/anti-icing operations.

Discharges of storm water from the Hercules Drive drainage area and Petroleum-based fuels, oil or lubricants (POL) Facility yard area, tanker truck parking area, and secondary containment areas will be regulated by the conditions in the permit for Outfall 100A/B. All discharges will be treated by an oil/water separator (OWS) prior to discharge. A quantitative description of the discharges from Outfall 100A/B in terms of significant effluent parameters based on Discharge Monitoring Report Data from January 2016 to June 2021 is shown in Attachment A-1. Attachment A-2 includes a site location map and Attachment A-3 includes a site plan that identifies building locations, the existing storm water drainage system, storage tank locations, and oil/water separators.

III. Permit Limitations and Conditions

The final effluent limitations, monitoring requirements, and any implementation schedule (if required) may be found in the permit.

IV. Permit Basis and Explanation of Effluent Limitation Derivation

Permit History

RIANG's most recent RIPDES permit, authorizing discharges from the above-mentioned facility, was issued on October 27, 2015. This permit became effective on January 1, 2016, was modified on December 14, 2016, and expired on December 31, 2020. The facility submitted an application for permit reissuance to the DEM on March 24, 2020. On September 3, 2020, the DEM issued an application complete letter to the facility. In accordance with 250-RICR-150-10-1 §13 of the Regulations for the Rhode Island Pollutant Discharge Elimination System, the facility's October 27, 2015 permit, as modified on December 14, 2016, remains in effect since the DEM has determined that a timely and complete permit application was submitted. Once this permit is reissued, it will supersede the October 27, 2015 permit and December 14, 2016 modifications to the permit.

Facility Description

The RIANG 143rd AW is located at the Quonset State Airport, in North Kingstown, Rhode Island. The airport is located approximately 1,200 feet west of the Narragansett Bay at its closest point. The Bay surrounds Quonset Point on three sides. The Base is a tenant of the State of Rhode Island and is responsible for the operation and maintenance of the approximately 88-acre tract on the western side of the airport property. Properties surrounding the Base include the airport taxiways and runways to the east, a public golf course to the north, and industrial facilities to the west and south. The 143 AW was originally located at T.F. Green Airport in Warwick, Rhode Island. In 1980, the unit moved to its present location. Before the tenancy of the 143 AW, the property was part of the Quonset Point Naval Air Station (NAS). The Station grounds are now occupied by the 143 AW. Buildings 1, 4, 9, 12, and 13 were refurbished for use by the ANG and Buildings 9 and 13 were demolished. Several old emergency generators have been removed from the base during new construction projects. Buildings 5 (Supply) and 8 (Fuel Cell) were substantially renovated in the past two-five years. The Paint Booth, which is in a separate wing of Building 8, is permanently closed due to risk of employee exposure to Chromium. A new paint booth will eventually be designed; in the interim, a temporary paint booth is operational in Building 575. A new flight simulator, Building 522, was also recently constructed. Repairs to the fire suppression system were made in Building 575 (Aircraft Maintenance); Building 8 was tied into the fire suppression system. Building 12 (Club house) was demolished and is under construction as of September 2021 for a gym. The new building number will be 523. Building 3 (Vehicle Maintenance) is being renovated and expanded in 2021 with future plans to relocate the facility across the street near the POL Facility. The POL Facility is being modernized over a 2 to 3 year period beginning in summer, 2021. An electrical central shelter (Building 18) will be removed with all electrical controls integrated into a new pump house at the POL Facility. Buildings 1 (Headquarters) and 4 (Warehouse) are in design and will be demolished/reconstructed in the next five years. Building 4 will be rebuilt within the existing footprint. All other buildings on the Base were constructed since 1980.

The purpose of the Base is to provide organizational and maintenance support to the 143 AW, as well as cybersecurity and combat communications. The 143 AW flies and maintains C-130J aircraft to support its airlift mission. The major support operations performed at the Base include aircraft refueling and defueling, aircraft deicing, aircraft maintenance, Aircraft Ground Equipment (AGE) maintenance, ground vehicle maintenance, refueling of ground vehicles, and facilities maintenance.

The operations related to aircraft maintenance include such activities as corrosion control, non-destructive inspection (NDI), fuel cell maintenance, engine maintenance and testing, hydraulics, washing, and wheel and tire maintenance. The AGE and ground vehicle maintenance operations include: fluid changes (e.g., oil, transmission, antifreeze, etc.); filter changes (gas, oil transmission, air, etc.); brake repair; lube, grease and repair of the axle and drive trains; body repair; welding; minor painting; and washing. Facilities maintenance operations include structural maintenance and repairs, painting, chemical treatment (i.e. pesticides, fertilizers, and herbicides), mowing, and utility maintenance.

Industrial Activities:

Aircraft, Vehicle and Equipment Maintenance: Storm water discharges covered in this category include runoff from areas where the following maintenance activities may occur: fluid changes; mechanical repairs; parts cleaning; vehicle washing; storage of vehicles and equipment waiting for repair or maintenance; and storage of the related materials and waste materials, which typically include: oil, fuel, solvents, antifreeze, hydraulic fluid, grease lubes, batteries, tires, or oil and fuel filters.

Vehicle and Aircraft Refueling Operations: Storm water discharges covered in this category include runoff from areas where refueling operations may occur. These activities include fuel delivery to the

facilities, fuel storage both in separate containers and in vehicle tanks, and fuel dispensing.

Aircraft Deicing: Discharges covered under this description include runoff from areas associated with aircraft deicing operations. This type of activity occurs during winter months on the Aircraft Parking Apron and deicing pad. The deicing pad and glycol recovery system consists of a dedicated deicing area, diversion manhole, two-way valve structure, and 25,000-gallon collection tank and was completed in September 2014.

Hazardous Materials Storage: Storage areas for new and waste materials typically include paints, solvents, oil, lubricants, propylene glycol, antifreeze, detergents, batteries, and used filters when the storage areas are either directly exposed to rainfall or when spills or leaks from these areas have the potential to enter the storm drainage system.

Raw Material Stockpiles: Storm water discharges covered in this category typically include runoff from stockpiles (i.e., salt, sand), and storage areas.

Site Buildings:

POL Facility: This facility is located in the central portion of the Base, is comprised of Building 14 (Office/Lab), bulk fuel structures 110 and 111 (105,000-gallon Jet A Fuel ASTs), 18 and 19 (pump and filter pad and shelter), and is used for storage and transfer of aviation fuels. This area is completely enclosed by a security fence with lockable gates and restricted to Base personnel unless escorted.

The Jet A Fuel ASTs are of the fixed-roof floating pan design and are located within concrete secondary containment with sufficient capacity for catastrophic failure of a full tank with adequate freeboard for precipitation (about 123% of tank capacity, based on measurement taken at the site). Following inspection of the containment to assure that there is no oil sheen or other evidence of leakage, the secondary containment is drained to an underground drainage system conveying flow to the POL's oil/water separator (OWS). Total volume for this OWS is 14,000 gallons with 8,000 gallons of capacity. The hatch doors to the drain valve stems for the containment is always closed and locked when not in use to prevent inadvertent discharge of collected storm water to the storm drainage system. The pump/filter structure can also be drained using a drain valve.

The fill and unloading stands are located on concrete pads designed to channel liquid to inlets connected to the OWS. Three refuelers (one 5,000-gallon, two 6,000-gallon capacity) and a 400-gallon "fuel bowser" transportable fuel tank are normally parked east of the fill/unloading stands. Each parking area is a concrete pad that slopes to an individual storm drain receptacle also connected to the OWS.

A 2,000-gallon, double-walled Jet A Fuel Reclamation AST with emergency vents is located on a concrete pad southeast of the pump/filter shelter. This tank and related infrastructure are slated for replacement as part of the POL Facility modernization project. Spills associated with this AST would flow east through grass to a storm water inlet.

Storm water runoff may be impacted by leaks or spills involving fuel transfer operations during fuel truck loading and unloading at the POL Facility. Sorbent materials and booms are available in the event of a spill. Spills that could not be readily contained using the spill containment equipment stored near the fill and unload stands would drain to the OWS. In the unlikely event a spill exceeding the capacity of the 8,000-gallon OWS, the discharge then flows through a 25,000-gallon OWS prior to discharge to Frys Pond.

RIANG is in the process of undergoing improvements to the POL Facility that include the following: upgrading existing fuel storage complex to meet current environmental standards and to be able to offload and fill multiple vehicles simultaneously, including construction and maintenance of a pump house building, reconfiguration of piping and equipment, new Jet A reclamation tank with secondary

containment, offload and fill stands including a new containment basin/holding tank, access and parking modifications, designated truck parking areas, and the addition of a Jellyfish Filter stormwater treatment practice. RIANG applied for a RIPDES Construction General Permit (CGP) on September 30, 2020 and was issued RIPDES CGP # RIR102106 on October 13, 2020 by DEM. The POL Facility upgrades began in the summer 2021.

Aircraft Parking Apron: The Apron (or ramp/flightline) is located on the east part of the Base and is used for parking, refueling, deicing, and minor maintenance of aircraft. This area is completely paved and drains to the main storm system through a 25,000-gallon capacity oil/water separator prior to discharge through the main storm drain to Frys Pond. This area is restricted to Base personnel unless accompanied by an escort.

During winter months, after blowing forced hot air on the aircraft to remove snow, deicing fluid is applied to aircraft on the Apron, only if necessary, using a Landoll Model TM 1800 deicing truck. The deicing truck has two tanks that contain a deicing fluid/water mix (1,650 gallons) and pure anti-icing fluid (170 gallons), respectively. The aircraft deicing liquid is mixed in the tank when the truck is being serviced. The mixture is 50% water/-50% aircraft deicing fluid. Approximately 100 to 1,000 gallons of mixed deicing fluid are used annually at the Base. (Anti-icing fluid is applied in rare circumstances for real world missions during snowstorms versus during routine training flights.) Additionally, the base constructed a deicing pad complete with a glycol recovery system. The deicing truck is typically staged inside Building 575 during winter months and outside Building 3 otherwise.

A deicing fluid recovery system is included on the Apron. Drainage from the ramp enters a valve structure (diversion manhole). A diversion manhole directs glycol effluent during deicing operations from the storm water system to a pump station. During normal (non-deicing) operations the valves allow flow to the storm water system. Diversion is accomplished with two valves that are motor actuated to open and close flow to the deicing fluid collection tank and storm water system accordingly. A control panel allows base personnel to control the valve orientation by push button. Aircraft Maintenance personnel manage the valves during deicing operations.

A control panel includes push button automation of the control valves. A single button is pushed to configure the system for deicing activities (i.e. close the storm water valve and open the deicing valve). After deicing activities are completed, a second and separate push button configures the system to direct storm water to the storm sewer (i.e. open the storm water valve and close the deicing valve). The control panel has audible alarms and lights to notify the operator of the systems configuration (i.e. deicing or storm water modes).

All fluid collected during deicing operations is recycled. Aircraft Maintenance is responsible for coordinating with the Civil Engineer Squadron to have the fluid tested, picked up by a contractor and recycled as needed. All paperwork and amounts are tracked and submitted to the base Environmental Management (EM) office. Additionally, Aircraft Maintenance reports total amount of deicing fluid during each use. The EM office reports the numbers to the DEM on an annual basis to satisfy the permit conditions for reporting.

RIANG has specific training missions that require formation flying. In the cases where two or more aircraft are required, one aircraft will be deiced on the deicing pad and the other remaining aircraft will be deiced in their current parking positions (1 thru 6). The deicing truck will circle the aircraft, deicing the aircraft using a 50/50 application mixture of heated water and deicing fluid, minimizing usage and environmental impact. Maintenance personnel will log all use of deicing fluid that includes dates, times, and amounts. A complete deicing Standard Operating Procedure (SOP) is located in the SWPPP.

Storm water runoff is most likely to be impacted by spills during refueling operations and deicing applications during winter months. Refueling operation spills could result from leaking or ruptured fuel loading lines, from leaking fittings on the refueler or the aircraft, from overfilling of the aircraft,

from venting of the aircraft's fuel tanks (typically during summer months), or from catastrophic failure of fuel tanks on either the refueler or the aircraft. Other spills within the apron area may result from hydraulic fluids, oils, deicing fluid application, and coolant from leaking lines on the aircraft or ground support equipment. Sorbent materials and booms are stored near the Flightline at several locations in the maintenance hangars.

Vehicle Maintenance Facility: This facility (Bldg. 3) is used for the general maintenance and refueling of ground vehicles, including heavy equipment, pickup trucks, step vans, and cars. There is light storage of hydraulic fluids, motor oil, and solvents onsite. These fluids are stored in secondary containment structures. In addition, the floor drains are normally plugged so that uncontained spills will not enter the sanitary sewer system. The building drains to a 160-gallon capacity oil/water separator prior to discharge into the sanitary sewage system as industrial wastewater. Therefore, the interior of this building does not have any connections to the storm water drainage system. A mobile spill kit is located in the maintenance area for rapid response to, and cleanup of, small spills that may occur.

The current Vehicle Maintenance renovation project includes an addition for a larger wash bay to accommodate the mobile refuelers as well as trenches to capture snowmelt for evaporation. The drain in the new wash bay will direct flow through a new 550-gallon capacity OWS prior to discharge to the sanitary sewer system.

Vehicles, including a deicing truck with a 500-gallon capacity glycol tank, are normally parked in the parking lot around the building when not in use. There is an unsheltered vehicle fueling area comprised of two pumping stations in front of the building. Fuel to the pumping stations is supplied from three ASTs containing diesel fuel (4,000 gallons), MOGAS (4,000 gallons), and kerosene (2,000 gallons). A 1,000-gallon, used-oil AST is located near the building's west end. All ASTs have integrated secondary containment. The fuel dispensers were replaced in 2021; sumps were installed and shear valves raised.

Storm water runoff is most likely to be impacted by spills or leaks outside the building. Spills outside the building could potentially result during fuel deliveries to the ASTs, from vehicles leaking while awaiting maintenance, transferring oils to the waste oil AST or from vehicles driving away without turning off the pumps. Spills in this area, if otherwise uncontained, would flow along the parking lot to storm drains or to storm drainage swales located outside the perimeter of the parking lot. This would eventually flow through the 25,000-gallon capacity oil/water separator in the main storm discharge line prior to discharge to Frys Pond.

A mixed sand/salt and soil storage area is also located immediately north of the Vehicle Maintenance facility. The area is comprised of concrete barriers on the east, north, and west sides and is covered to prevent runoff into the storm drainage system when not in use. The sand/salt mixture is applied to roadways and sidewalks as needed during winter months. A new covered shelter is being constructed during 2021 in the parking area

Base Supply and HAZMAT Pharmacy: These facilities (Bldgs. 4 and 5) are located in the south-central portion of the Base. All non-bulk portable quantities (i.e., 55-gallon drums or smaller) of hazardous substances are received into Building 5 (Base Supply) through loading docks located on the east end of the building.

The larger containers of antifreeze, as well as various types of lubricating oils ordered by individual shops are delivered to the shops, fully sealed, where they are stored on secondary containment. Glycol-based deicing agents in 275-gallon totes are stored outside in a vinyl tent on top of spill pallets within a fenced area between the buildings. In addition, there is a flammable storage locker with integral secondary containment in the fenced area, typically containing small containers of less than 5 gallons. Old equipment, most of which can be recycled, is stored in this same area. Other solid waste such as aircraft tires or scrap metal are stored inside shops until such time they can be returned to the Defense Logistics Agency, Distribution Services.

The smaller containers (typically 5 gallons or less) are transferred to the HAZMAT Pharmacy, inside Building 4. These containers are stored in one of three normally locked hazardous material storage rooms. Each of these rooms is constructed of concrete block with a concrete floor that is epoxy paint-coated and a four-inch high concrete sill across the doorway. Containers of solvents, paints, hydraulic fluids, lubricating oils, and corrosion prevention compounds in quantities of up to 5 gallons are stored in these rooms.

Storm water is most likely to be impacted from a release from a container during transfers to and from the buildings or storage areas. A spill may occur if a container is accidentally damaged during transfers. Building 4 is being demolished and redesigned; it will include space for a new Central Accumulation Point for the base, most likely in a hazardous materials storage room (Building 17 would no longer house the CAP).

Headquarters and Operations Buildings: These buildings (Bldgs. 1 & 7) are primarily used for administrative purposes.

Storm water runoff would most likely be impacted from a leak or spill during fuel transfers to the generator's AST. Spilled fuel could remain in the nearby soil or flow to a nearby storm drain. The storm drain is connected to the 25,000-gallon capacity OWS via underground piping, so a release should be contained and recovered before reaching Frys Pond.

Corrosion Control Hangar/Fuel Cell: This aircraft maintenance facility (Bldg. 8) is on the Flightline. Spot painting of aircraft is no longer performed in this hangar. The interior of this building has no floor drains.

Fluids stored inside the building include small quantities of corrosion inhibiting compounds, cleaners, spray paint and solvents stored in fireproof lockers with integral secondary containment. In addition, Type I aircraft cleaning compounds are stored on "Poly Spill" pallets which have integral secondary containment. Occasionally, a defueling bowser with a capacity of 400 gallons may be located in the building during aircraft defueling.

A closed loop, 100% recycled aircraft wash system was installed in the Fuel Cell in 2019. Water in the base's drinking water supply lines is used; processed water is recirculated through filters and pumped back into the system. When the aircraft wash system is underway, floor drains are open so that wash water can drain to an 8000-gallon holding tank under the north end of the building. The wash water is tested before being properly disposed of offsite by a contractor.

Spills in this building can occur from leaking, ruptured, or overturned containers. Spills would be contained on the concrete floor unless the floor drains were open; in the latter instance, any release would be captured in the holding tank.

Trench drains in this building are plugged so that no wastewater discharges to the sanitary sewer system. Sorbent materials are available to clean up small spills on the concrete floor.

No significant loss of oil or hazardous material has been reported in the last three years.

The original paint booth for the base is located on the south side of Building 8. It was permanently closed in January 2020 after a Safety and Occupational Health inspection. In the future, a new paint booth is planned that will be modern and code compliant.

Aircraft Maintenance Hangar: The Hangar (Building 575) is located on the north end of the Flightline and is used to perform aircraft maintenance. Maintenance activities are primarily conducted indoors, although some maintenance may be conducted on the Apron. Building 575 is a multipurpose building which houses a variety of shops such as tire maintenance, corrosion control, structural repair, pneudraulics, metals technology, electrical, phase dock (aircraft inspections) and a

tool shop.

The metals technology shop contains small quantities of cutting oil, paints, carbon cleaner, and solvent which are stored in suitable storage lockers with integral secondary containment. In addition, there is a corrosives storage cabinet used to store acid that has integral acid resistant storage trays that also serve as a secondary containment.

Most shops inside the Hangar store relatively small quantities of operating fluids, paints, solvents, cleaning fluids, and corrosives. These substances are typically located in a suitable storage/flammables locker with integral secondary containment.

In the phase dock area where aircraft inspections and maintenance occur, the floors slope away from the doors and the concrete is polyurethane sealed. Spills in this area could occur from leaking fuel, hydraulic fluids, or from drums or containers of aircraft cleaner that may be in use. Also, in this area, there is a temporary, portable, paint booth for rolling paint/touch ups that was installed after the original paint booth in Building 8 was permanently closed.

A 153-gallon integral AST containing diesel fuel for an emergency generator is housed beneath the generator's engine which is on a concrete pad next to the building. The generator is regularly inspected and maintained to assure that it will operate when needed. Storm water runoff would most likely be impacted from leaks or spills associated with transfers of fuel to the generator AST.

Aircraft Maintenance: This maintenance facility (Bldg. 571) is on the northeast portion of the Base. The facility includes aircraft engine maintenance, aircraft ground equipment (AGE) maintenance, avionics, and the Non-Destructive Inspection (NDI) lab.

AGE maintenance operations are typically conducted indoors or outdoors on the Flightline when aircraft require service. Hazardous materials stored inside the maintenance area include new and used motor oil, lube oil, miscellaneous cleaners, lubricants, paints, and solvents, in capacities of 55-gallons or less in suitable storage lockers with integral secondary containments. A covered outdoor area north of the building is used to store AGE that is not on the Flightline. A scope of work to redesign the outdoor areas where AGE equipment is stored is being drafted in order to minimize risk of releases from oil-filled equipment and stormwater runoff.

Fire Department: This facility (Bldg. 11) is used for storage of fire engines and other related emergency response vehicles and equipment. A building renovation and addition was completed in 2021. An OWS was removed. Trenches were modified to collect snowmelt for evaporation; all piping was disconnected so that these trenches no longer discharge to the wastewater system. All emergency response vehicles are now serviced at the Vehicle Maintenance Building, eliminating the need for storage of antifreeze, motor oil, and hydraulic fluids onsite. Small quantities of premix fuel and gasoline to operate chain saws and small equipment are stored in a flammable storage locker with integral secondary containment inside the building. An 870-gallon integral AST containing diesel fuel for an emergency generator is housed beneath the new generator's engine on an elevated concrete pad approximately 100' from the building. The generator is regularly inspected and maintained to assure that it will operate when needed. An emergency response trailer containing approximately 1000 gallons of Aqueous Film Forming Foam (AFFF) is parked outside the building. Three other response vehicles contain varying amounts of AFFF (56 gals to 400 gallons) are parked inside the building when not in use.

Spills from within this building can result from leaking containers, rupture or leaking of fuel tanks, or from containers being damaged or turned over. Other than a release of AFFF foam during firefighting, spills in this area would tend to be of small volume. The interior of this building does not have any connection to the storm water drainage system. Sorbent materials are available to clean up small spills.

Pump House: This facility (Bldg. 570) is used to control fire suppression systems in Buildings 575 and 8. AFFF and High Expansion Foam (HEF) are stored inside in 5-gallon pails and 55-gallon drums. The Air Force conducted a nationwide swap out of old AFFF in 2016-2017 for more ecologically friendly foam. RIANG purchased Phos Chek 3% AFFF MS (Aquafilm AF-3MS) for firefighting. An outside contractor maintains the fire suppression system.

Since the last permit reissuance, RIANG ceased using fire suppression foam during firefighting training, and currently uses only water. Discharges from these actions are not authorized under this permit.

Hazardous Waste Central Accumulation Point: This building (Bldg. 17) is used as the central accumulation point (CAP) for hazardous waste awaiting removal by the Defense Reutilization and Marketing Office (DRMO) and is located in the northern corner of the Base. All hazardous waste containers at the CAP are stored on spill pallets that have integral secondary containment. Once items are moved to the CAP, they have 180 days to be removed by DRMO as RIANG is a Small Quantity Generator for hazardous waste. The interior of this building does not have any connections to the storm water drainage system. A new, modern CAP will be established when Building 4 is demolished and reconstructed in the next few years.

Civil Engineering: The Civil Engineer Squadron (CES) facility (Bldg. 2) is located in the southwest portion of the Base and includes a number of administrative offices as well as smaller maintenance areas. These maintenance areas typically possess a flammables cabinet with integral secondary containment that stores small quantities (i.e., 5 gallons or less) of maintenance fluids, including solvents, adhesives, paints, oils, household pesticides, and other products. The facilities are primarily used for the design and maintenance of Base structures and properties.

Storm water runoff would most likely be impacted from leaks or spills associated with vehicles circulating in the parking area.

Site Drainage/Storm Water Collection and Treatment System

The RIANG Base is located within a single drainage area. There is currently one corresponding location or point source located outside the installation where most storm water runoff generated on the Base is ultimately discharged, designated as Outfall 001. The total area drained to this outfall is 88 acres, with 52 acres of impervious area. Drainage is by overland flow to surface drainage ditches and storm drain inlets, which are connected by a network of underground pipes. The storm water collection system flows through a 25,000-gallon OWS and is discharged via a 60-inch storm drain in a concrete headwall to Frys Pond at a point immediately adjacent to a municipal golf course, near the Base's northern boundary. Frys Pond discharges into Narragansett Bay via an underground culvert.

Storm water from the surrounding roads and adjacent industrial sites also feed into the storm water system prior to reaching the Base and Outfall 001.

For the permit's effluent limitations and monitoring requirements, Outfall 100 is defined as a sampling location immediately downstream from the 8,000-gallon OWS associated with the POL Facility and the Hercules Drive storm water drainage area at a location within the 30-inch Reinforced Concrete Pipe storm drainage line, prior to commingling with off-site storm water inputs. In order to eliminate the impact of off-site storm water and tidal influences to Outfall 001, the Outfall 100 limitations and monitoring requirements have replaced those for Outfall 001 from the previous reissuance as of the effective date of the 2016 permit modification (December 14, 2016). As noted above in the Facility Description, future upgrades to the POL Facility stormwater treatment will consist of a containment basin prior to the oil/water separator and an in-line Jellyfish Filter installed downstream of the separator. Following the POL Facility upgrades, samples for wet weather storm events will be collected immediately downstream from the

Jellyfish Filter. Also, following the POL Facility upgrades, samples for dry weather discharges of accumulated storm water from the POL Facility secondary containment area will be collected immediately downstream from the Jellyfish Filter.

Receiving Water Description

Outfalls 001 and 100 discharge to Frys Pond in the segment defined as water body ID number RI0007027L-06. This segment is described as Frys Pond in the Town of North Kingstown. This segment is located in North Kingstown and is classified as a Class A water body according to the RI Water Quality Regulations. Class A waters are designated for primary and secondary contact recreational activities and for fish and wildlife habitat. They shall be suitable for compatible industrial processes and cooling, hydropower, aquacultural uses, navigation, and irrigation and other agricultural uses. These waters shall have excellent aesthetic value. Currently, this water body is not listed as being impaired.

Permit Limit Development

The requirements set forth in this permit are from the State's Water Quality Regulations and the State's Regulations for the Rhode Island Pollutant Discharge Elimination System, both filed pursuant to RIGL Chapter 46-12, as amended. RIDEM's primary authority over the permit comes from EPA's delegation of the program in September 1984 under the Federal Clean Water Act (CWA).

Development of RIPDES permit limitations is a multi-step process consisting of: determining if Federal effluent guidelines apply; calculation of allowable water quality-based discharge levels based on background data and available dilution; assigning appropriate Best Professional Judgement (BPJ) based limits; comparing existing and proposed limits; comparing discharge data to proposed limits; performing an antidegradation/antibacksliding analysis to determine the final permit limits; and developing interim limits as appropriate.

Water quality criteria are comprised of numeric and narrative criteria. Numeric criteria are scientifically derived ambient concentrations developed by EPA or the State for various pollutants of concern to protect human health and aquatic life. Narrative criteria are statements that describe the desired water quality goal. A technology-based limit is a numeric limit, which is determined by examining the capability of a treatment process to reduce or eliminate pollutants.

The draft RIPDES permit for RIANG, authorizing the discharge of treated storm water, includes numeric effluent limitations and requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP) for additional protection of the environment. RIANG has submitted a plan on September 1, 2016 for the implementation of the appropriate storm water controls at the vehicle maintenance/refueling facility (Building 3). An amended SWPPP will need to be submitted within one (1) year of the installation of stormwater controls at the vehicle maintenance/refueling facility when it is reconstructed. The effluent parameters in the draft permit are discussed in more detail below following the effluent limitation derivation for the one outfall being regulated by this permit (Outfall 100A/B).

Technology-based Limits

Technology based treatment requirements represent the minimum level of control that must be imposed under Section 402 and 301(b) of the CWA (see 40 CFR 125 Subpart A) to meet Best Practicable Control Technology Currently Available (BPT), Best Conventional Control Technology (BCT) for conventional pollutants, and Best Available Technology Economically Achievable (BAT) for toxic pollutants. EPA has not promulgated National Effluent Guidelines for storm water discharges from bulk storage petroleum facilities, but has promulgated Effluent Guidelines from facilities that operate as primary airports (defined at 49 U.S.C. 47102).

In August 2000 the U.S. EPA reissued the *Preliminary Data Summary-Airport Deicing Operations*

(Revised). The DEM has utilized this document for guidance in reviewing the Storm Water Pollution Prevention Plan (SWPPP), in addressing toxicity issues with aircraft and pavement deicing/anti-icing agents used, and verifying the use of the most recent and acceptable BMPs to eliminate pollution from entering the storm water drainage system. The Preliminary Data Summary provides information about the air transportation industry and the best management practices being employed for aircraft and airfield deicing operations, as well as for the collection, containment, recovery, and treatment of wastewater containing deicing agents. EPA conducted a study of airport deicing operations to collect engineering, economic, and environmental data for use in determining whether national categorical effluent limitations guidelines and standards should be developed for this category of dischargers. A secondary purpose of this study was to provide information to permit writers, control authorities, airports, and airlines in developing pollutant control strategies for discharges from airport deicing operations.

Following the Preliminary Data Summary, EPA finalized effluent guidelines (ELGs) in May 2012. The EPA issued technology-based effluent limitations guidelines and new source performance standards to control discharges of pollutants from airport deicing operations (40 CFR Part 449). The requirements generally apply to wastewater associated with the deicing of airfield pavement at primary airports. The rule also establishes new source performance standards for wastewater discharges associated with aircraft deicing for a subset of new airports.

According to the ELGs, existing and new primary airports with 1,000 or more annual jet departures ("non-propeller aircraft") that generate wastewater associated with airfield pavement deicing are to use non-urea containing deicers, or alternatively, meet a numeric effluent limitation for ammonia. Also, new airports with 10,000 annual departures located in certain cold climate zones are required to collect 60 percent of aircraft deicing fluid after deicing. Airports that discharge the collected aircraft deicing fluid directly to waters of the U.S. must also meet numeric discharge requirements for chemical oxygen demand. The rule does not establish requirements for aircraft deicing discharges at existing airports.

According to RIANG, the main aircraft flown out of the 143d AW is the C-130J, which is a large prop aircraft. Other transient landing and departures are infrequent and not appreciable. Therefore, RIANG does not meet the applicability threshold of "at least 1,000 annual non-propeller aircraft departures" as an existing facility. In the absence of technology-based guidelines, DEM is authorized to use Best Professional Judgement (BPJ) to establish effluent limitations, in accordance with Section 402(a)(1) of the CWA.

Under Section 301 (b)(1)(C) of the CWA, discharges are subject to effluent limitations based on water quality standards. The Rhode Island Water Quality Standards include a narrative statement that prohibits the discharge of any pollutant or combination of pollutants in quantities that would be toxic or injurious to aquatic life. In addition, the State has adopted EPA's numerical criteria for specific toxic pollutants and toxicity criteria as published in the EPA Quality Criteria for Water, 1986, (EPA 440/5-86-001) as amended.

The effluent monitoring requirements have been specified in accordance with RIPDES regulations as well as 40 CFR 122.41 (j), 122.44 (i), and 122.48 to yield data representative of the discharge.

BPJ-based Limits

Effluent limitations for Outfall 100 have been established for total suspended solids (TSS) and oil and grease. The daily maximum effluent limitation of 20 mg/l for TSS is a BPJ-based limit based on the ability of bulk petroleum storage terminals to comply with the numeric limit utilizing proper BMPs and using oil/water separators and or holding/equalization basins as the storm water treatment technology. TSS has been limited to account for the potential for petroleum hydrocarbons to adsorb or absorb to particulates and be transported with the suspended material. The daily maximum effluent limitation of 15 mg/l for oil and grease is a BPJ based limit based on

American Petroleum Institute (API) oil/water separator guidelines. The draft permit limit for oil and grease remains unchanged from the previous permit at 15 mg/L daily maximum. Performance data from facilities similar to this facility indicate that these effluent limits can be achieved through the proper operation of a correctly sized oil/water separator, appropriate source controls, routine inspections, preventative maintenance, good housekeeping programs, and effective best management practices (BMPs).

Outfall 100 must also be monitored for benzene, toluene, ethylbenzene, total xylenes, and sixteen (16) polynuclear aromatic hydrocarbons (PAHs). These pollutants were chosen because they are indicators used to characterize contamination from the petroleum hydrocarbons stored at the site. The permit requires quarterly analysis of BTEX and the PAHs. Monitoring for Ethanol has been removed from the requirements for Outfall 100A/B as historic effluent monitoring has demonstrated that the Ethanol concentrations in RIANG's discharges are below the required MDL of 2.0 mg/L.

Flow: The treatment technology for storm water runoff employed by this facility are oil/water separators. These devices use gravity to separate the lower density oils from water; resulting in an oil phase above the oil/water interface, and a heavier particulate (sludge) phase on the bottom of the oil/water separator. To ensure proper operation of the installed oil/water separators such that the oil and/or particulate phases are not entrained to the waterway, DEM is requiring that the release of runoff from any secondary containment area or holding basin shall be controlled so that this discharge alone or in combination with all other wastewaters does not exceed the design flow rate for the oil/water separator or cause violations of the effluent limitations specified in the permit. A separate control valve for the secondary containment areas associated with the POL facility allows for the release of storm water from this area. Flow must be monitored and reported for this outfall to ensure that the oil/water separator design flow rate is not exceeded.

Water Quality-based Limits

The narrative effluent limitations for pH are based on water quality criteria established in the State's Water Quality Regulations for Freshwater Receiving Waters. In accordance with 40 CFR Part 122.4(d)(1)(iii), it is only necessary to establish limits for those pollutants in the discharge which have the reasonable potential to cause or contribute to the exceedance of the in-stream criteria. With the exception of pH, all other pollutants that have water quality criterion were listed as not being present in the discharge (i.e., non-detect) on the permit application. Therefore, the only pollutant that requires a water quality-based limit is pH.

Aircraft and Pavement Deicing/Anti-Icing Permit Requirements:

The permit requires a best management practice (BMP) approach for glycol management. A storm water BMP is defined as any program, technology, process, citing criteria, operating method, measure or devices that controls, removes or reduces pollution. Based upon the factors cited below, the permit requires that RIANG develop and implement a Storm Water Pollution Prevention Plan that includes BMPs to promote source reduction and pollution prevention and to be protective of water quality standards and criteria in the receiving waters such as dissolved oxygen, aquatic toxicity, foaming, nuisance odors, and nuisance bacteria growths. The permit requires the development of BMPs to minimize the amount of fluids applied to aircraft, minimize contact and dilution with storm water, prevent releases from accidental spills or leaks, minimize releases from melting deicer contaminated snow, and the use of available technology and controls that collect and dispose of contaminated storm water and prevents the dry weather discharge of deicing fluids.

As part of the efforts to manage contaminated runoff due to deicing activities, a C-130J aircraft parking apron deicing pad and glycol recovery system was constructed at the RIANG base in 2014. The pad and system consist of a dedicated deicing area, diversion manhole, two-way valve structure and 25,000-gallon collection tank.

The permit does not authorize the use of Urea or Glycols for runway or pavement deicing and requires RIANG to implement runway and pavement deicing BMPs that include pollution prevention such as choosing environmentally sensitive products and source reduction BMPs such as anti-icing techniques. The proposed BMPs when implemented will meet the narrative criteria of "no toxics in toxic amounts".

The permit requires RIANG to implement BMPs and a Glycol Management Plan that reduces the potential for foaming caused by the discharge of deicing chemicals.

Deicing/Anti-Icing:

For the purposes of this permit, the term "deicing" is defined as the process to remove frost, snow, or ice and "anti-icing" is the process that prevents the accumulation of frost, snow, or ice. This permit covers only deicing activities.

Propylene and ethylene glycol are the deicing compounds most commonly used at airports. Environmental impacts associated with the discharge of propylene glycol to surface waters include: reduction in dissolved oxygen (DO) levels, aquatic life toxicity, offensive odors and the growth of nuisance bacteria. Deicing/anti-icing operations may be performed at RIANG from October through May.

Foaming:

The RI WQ Regulations establish narrative criteria for foam of "none allowable". Airplane deicing chemicals (commonly referred to as ADFs) are known to contain additives including surfactants. The permit contains a condition that states "The effluent shall contain neither a visible oil sheen, foam, nor floating solids at any time".

SWPPP: Pursuant to Section 304(e) of the CWA and 40 CFR§125.103(b), best management practices (BMPs) may be expressly incorporated into a permit on a case-by-case basis where necessary to carry out Section 402(a)(1) of the CWA. The facility stores and handles pollutants listed as toxic under Section 307(a)(1) of the CWA or pollutants listed as hazardous under Section 311 of the CWA and has ancillary operations that could result in significant amounts of these pollutants reaching surface waters. These operations include one or more of the following items from which there is or could be site runoff: materials storage, materials processing and handling, blending operations, intra-facility transfers, and loading/unloading of product. To control these activities/operations, which could contribute pollutants to waters of the United States via storm water discharges, at this facility; the permit requires this facility to develop a Storm Water Pollution Prevention Plan (SWPPP) containing BMPs appropriate for this specific facility. The BMPs should include processes, procedures, schedule of activities, prohibitions on practices, and other management practices that prevent or reduce the discharge of pollutants in storm water runoff. The specific SWPPP requirements have been modified in this permit to be consistent with the Storm Water Management Plan (SWMP) requirements from Rhode Island's Multi-Sector General Permit for Storm Water Discharge Associated with Industrial Activity (MSGP) which became effective May 3, 2019. The draft permit requires the permittee to update and implement the SWPPP one (1) year following the installation of stormwater controls at the vehicle maintenance/refueling facility.

Certain required elements of the SWPPP are listed below.

- Description of Potential Pollutant Sources
- Storm Water Management Controls
- Deicing Fluid Management/Source Reduction/Annual Deicing Management Report
- Fertilizer and Pesticide Management
- Post-Construction Storm Water Management in New Development and Redevelopment

- Non-Storm Water Discharges
- Site Inspection
- Consistency with Other Plans

Prohibited Discharges

Non-storm Water Discharges: This permit authorizes certain non-storm water discharges consistent with DEM's 2019 Multi-Sector General Permit. Allowable non-storm water discharges are limited to discharges from firefighting activities; fire hydrant flushings; routine external building washdown/power wash water that does not use detergents or hazardous cleaning products (such as those containing bleach, hydrofluoric acid, muriatic acid, sodium hydroxide, nonylphenols); lawn watering; uncontaminated groundwater; springs; air conditioning condensate; potable waterline flushings; clear water rinses of C-130J aircraft; irrigation drainage; foundation or footing drains where flows are not contaminated with process materials, such as solvents, or contaminated by contact with soils, where spills or leaks of toxic or hazardous materials have occurred; water sprayed for dust control or at a truck load wet-down station; incidental windblown mist from cooling towers that collects on rooftops or adjacent portions of the facility, but NOT intentional discharges from the cooling tower (e.g., "piped" cooling tower blowdown or drains); uncontaminated utility vault dewatering; dechlorinated water line testing water; hydrostatic test water that does not contain any treatment chemicals and is not contaminated with process chemicals; and discharges from washing of vehicles provided: chemicals, soaps, detergents, hazardous cleaning products (such as those containing bleach, hydrofluoric acid, muriatic acid, sodium hydroxide, nonylphenols), steam, or heated water are not used; cleaning is restricted to the outside of the vehicle (e.g., no engines, transmissions, undercarriages, or truck beds); or washing is not used to remove accumulated industrial materials, paint residues, heavy metals or any other potentially hazardous materials from surfaces. To prevent hydrocarbon and/or particulate entrainment (carry-over) from the treatment system, the permittee shall not add chemicals, soaps, detergents, solvents, emulsifiers, etc. to any fresh water wash down collection and treatment system without prior approval by the DEM.

All other non-storm water discharges including fire protection foam (either in concentrate form or as a foam diluted with water) not associated with firefighting activities, sludge and/or bottom deposits, discharges from floor drains/trench drains located within building and/or hangars, vehicle/aircraft/equipment washing, rubber removal practices, dry weather discharges of deicing chemicals, engine compressor washes of C-130J aircraft (except for the clear water rinses of C-130J aircraft), and sanitary wastewater are excluded from coverage under this permit. Thus, the permittee is required to obtain a separate RIPDES permit for these non-storm water discharges or seek the necessary approval(s) from the appropriate local pretreatment authority to discharge to the sanitary sewer system.

Tank Bottom Water: The bottom of many petroleum product storage tanks may contain a layer of water that has separated from the stored petroleum product due to the density difference between the product and water. As this water coalesces and then settles to the bottom of the tank, it partitions (dissolves) PAHs from the petroleum product. Through this process, the water selectively extracts some of these hazardous substances and may become toxic. To avoid product contamination, terminal operators drain this water layer to prevent transfer with the product.

Whereas storm water contacts only those hydrocarbons spilled on the ground and then only for short periods of time; tank bottom water remains in intimate proximity with petroleum derivatives for prolonged periods of time, allowing the pollutants the necessary contact time to dissolve into the aqueous phase. Storm water also is discharged from the facility in a timely fashion to maintain maximum storage capacity within the diked areas at all times. This procedure also minimizes the contact time between petroleum product and storm water.

The DEM considers tank bottom water a "process wastewater", since it can partition soluble toxic materials from petroleum product with time. To protect surface waters from pollutants dissolved in tank bottom water, the DEM is prohibiting the permittee from discharging any tank bottom water alone or in combination with storm water or other wastewater directly from the facility. The facility is required by the permit to dispose of tank bottom water off-site by a licensed hazardous waste contractor.

Hydrostatic Test Water: To protect Frys Pond from pollutants dissolved in any hydrostatic test water the DEM is prohibiting the permittee from discharging tank and/or piping hydrostatic-test water, and tank and/or pipe cleaning residual/debris associated with hydrostatic-testing procedures alone or in combination with storm water or other wastewater to the separate storm sewer system or to waters of the State.

Contaminated Groundwater: Infiltration/Inflow of contaminated groundwater into the storm water collection and treatment system is not authorized by this permit and must be addressed by the permittee pursuant to the Rules and Regulations for the Investigation and Remediation of Hazardous Material Releases.

Antibacksliding

Provided below is a brief introduction to Antibacksliding and Antidegradation; as well as a discussion on how the two policies were used to calculate water quality-based limits.

Antibacksliding restricts the level of relaxation of water quality-based limits from the previous permit. Section 303(d)(4) of the Clean Water Act addresses antibacksliding as the following:

Section 303(d)(4)

1. Standards not attained – For receiving waters that have not attained the applicable water quality standards, limits based on a TMDL or WLA can only be revised if the water quality standards will be met. This may be done by (i) determining that the cumulative effect of all such revised limits would assure the attainment of such water quality standards; or (ii) removing the designated use which is not being attained in accordance with regulations under Section 303.
2. Standards attained – For receiving waters achieving or exceeding applicable water quality standards, limits can be relaxed if the revision is consistent with the State's Antidegradation Policy.

Therefore, in order to determine whether backsliding is permissible, the first question that must be asked is whether or not the receiving water is attaining the water quality standard. The Office has determined the most appropriate evaluation of existing water quality is by calculating pollutant levels, which would result after the consideration of all currently valid RIPDES permit limits or historic discharge data (whichever is greater), background data (when available), and any new information (i.e., dilution factors).

Antidegradation

The DEM's "*Policy on the Implementation of the Antidegradation Provisions of the Rhode Island Water Quality Regulations July 2006*" (the Policy) established four tiers of water quality protection:

Tier 1. In all surface waters, existing uses and the level of water quality necessary to protect the existing uses shall be maintained and protected.

Tier 2. In waters where the existing water quality criteria exceeds the levels necessary to support

the propagation of fish and wildlife and recreation in and on the water, that quality shall be maintained and protected except for insignificant changes in water quality as determined by the Director and in accordance with the Antidegradation Implementation Policy, as amended. In addition, the Director may allow significant degradation, which is determined to be necessary to achieve important economic or social benefits to the State in accordance with the Antidegradation Policy.

Tier 2½. Where high quality waters constitute Special Resource Protection Waters SRPWs¹, there shall be no measurable degradation of the existing water quality necessary to protect the characteristics which cause the waterbody to be designated a SRPW. Notwithstanding that all public drinking water supplies are SRPWs, public drinking water suppliers may undertake temporary and short-term activities within the boundary perimeter of a public drinking water supply impoundment for essential maintenance or to address emergency conditions in order to prevent adverse effect on public health or safety. These activities must comply with the requirements set forth in Tier 1 and Tier 2.

Tier 3. Where high quality waters constitute an Outstanding Natural Resource ONRWs², that water quality shall be maintained and protected. The State may allow some limited activities that result in temporary or short-term changes in the water quality of an ONRW. Such activities must not permanently degrade water quality or result in water quality lower than necessary to protect the existing uses in the ONRW.

The formulas previously presented ensure that permit limitations are based upon water quality criteria and methodologies established to ensure that all designated uses will be met.

In terms of the applicability of Tier 2 of the Policy, a water body is assessed as being high quality on a parameter-by-parameter basis. In accordance with Part II of the Policy, "Antidegradation applies to all new or increased projects or activities which may lower water quality or affect existing water uses, including but not limited to all 401 Water Quality Certification reviews and any new, reissued, or modified RIPDES permits." Part VI.A of the Policy indicates that it is not applicable to activities which result in insignificant (i.e., short-term minor) changes in water quality and that significant changes in water quality will only be allowed if it is necessary to accommodate important economic and social development in the area in which the receiving waters are located (important benefits demonstration). Part VI.B.4 of the Policy states that: "Theoretically, any new or increased discharge or activity could lower existing water quality and thus require the important benefits demonstration. However, DEM will: 1) evaluate applications on a case-by-case basis, using BPJ and all pertinent and available facts, including scientific and technical data and calculations as provided by the applicant; and 2) determine whether the incremental loss is significant enough to require the important benefits demonstration described below. [If not then as a general rule DEM will allocate no more than 20%.] Some of the considerations which will be made to determine if an impact is significant in each site-specific decision are: 1) percent change in water quality parameter value and their temporal distribution; 2) quality and value of the resource; 3) cumulative impact of discharges and activities on water quality to date; 4) measurability of the change; 5) visibility of the change; 6) impact on fish and wildlife habitat; and 7) impact on potential and existing uses. As a general guide, any discharge or activity which consumes greater than 20% of the remaining assimilative capacity may be deemed significant and invoke full requirements to demonstrate important economic or social benefits."

In terms of a RIPDES permit, an increased discharge is defined as an increase in any limitation, which would result in an increased mass loading to a receiving water. The baseline for this comparison would be the monthly average mass loading established in the previous permit. It would be inappropriate to use the daily maximum mass loading since the Policy is not applicable to short-

¹ SRPWs are surface waters identified by the Director as having significant recreational or ecological uses.

² ONRWs are a special subset of high-quality water bodies, identified by the State as having significant recreational or ecological water uses.

term changes in water quality.

For the purposes of ensuring that the revised limit is consistent with the requirements of antidegradation, existing water quality must be defined. As explained earlier, DEM evaluates existing water quality by determining the pollutant levels which would result under the design conditions appropriate for the particular criteria (i.e., background water quality, when available and/or appropriate, non-point source inputs; and existing RIPDES permit limitations or recent historical discharge data, whichever is higher). In general, available data would be used to make this determination.

Use the above-mentioned criteria, the present instream water quality C_p is defined as:

$$C_p = \frac{(DF - 1) \cdot C_b + (1 \cdot C_d)}{DF}$$

where: C_b = background concentration³
 C_d = discharge data⁴
DF = dilution factor

In this permit, all monthly average limitations are either the same as or more stringent than the limits in the October 27, 2015 permit. Therefore, the limits contained in this permit are consistent with the Department's anti-degradation policy.

The remaining general and specific conditions of the permit are based on the RIPDES regulations as well as 40 CFR Parts 122 through 125 and consist primarily of management requirements common to all permits.

³ Data collected at a location that is unimpacted by significant point source discharges.

⁴ Discharge data refers to the maximum of the permit limit or the historic discharge level. The historic discharge level is determined by calculating the upper 95th confidence interval for the monthly average reported data for the past five (5) years. For specific cases, changes in treatment efficiency or pretreatment limitations may support the use of an alternative period of time.

The effluent limitations and/or monitor-only requirements proposed in this permit for Outfall 100A/B are listed in Table 1 below. The once per quarter monitoring frequency has been maintained in order to ensure the effectiveness of the storm water controls at the POL Facility.

Parameter	Effluent Limitation

V. Comment Period, Hearing Requests, and Procedures for Final Decisions

All persons, including applicants, who believe any condition of the draft permit is inappropriate must raise all issues and submit all available arguments and all supporting material for their arguments in full by the close of the public comment period, to the Rhode Island Department of Environmental Management, Office of Water Resources, 235 Promenade Street, Providence, Rhode Island, 02908-5767. In accordance with Chapter 46-17.4 of Rhode Island General Laws, a public hearing will be held prior to the close of the public comment period, if requested. In reaching a final decision on the draft permit the Director will respond to all significant comments and make these responses available to the public at DEM's Providence office.

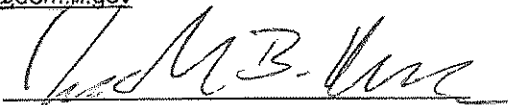

Following the close of the comment period, and after a public hearing (if requested), the Director will issue a final permit decision and forward a copy of the final decision to the applicant and each person who has submitted written comments, provided oral testimony, or requested notice. Within thirty (30) days following the notice of the final permit decision any interested person may submit a request for a formal hearing to reconsider or contest the final decision. Requests for formal hearings must satisfy the requirements of 250-RICR-150-10-1.50 of the Regulations for the Rhode Island Pollutant Discharge Elimination System.

VI. DEM Contact

Additional information concerning the permit may be obtained between the hours of 8:30 a.m. and 4:00 p.m., Monday through Friday, excluding holidays from:

Aaron Mello, Environmental Engineer II
Department of Environmental Management/ Office of Water Resources
235 Promenade Street
Providence, Rhode Island 02908
Telephone: (401) 222-4700, Ext: 2777405
