To whom it may concern,

My family spends valuable time during our annual getaway camping at Oceana SVRA. It's a highlight to our OHV season. I have learned that potential legislation may begin limiting our use. I believe there are far more important actions to be taken to improve our air quality. Additionally, I am not convinced that this closure will in fact be an improvement. I ask that you investigate the validity of silica coming from the SVRA and determine the level of impact the marine biological material coming from the ocean has on all the air monitoring data?

What percentage of dust is coming from the SVRA?

Those answers should be scientifically proven before taking action that will definitely impact family enjoyment while it's unknown if the action will achieve its desired result.
