

World's Greatest Latest Dinosaur Discoveries Support Scripture

Dr. Mary Schweitzer made the dinosaur discovery of the century... and she didn't want to tell anyone!

It all began with the smell of death which was common with the Hell Creek Formation fossils. The fossil sites often smell like a rotting corpse. Most paleontologists did not think twice about its implications. But Dr. Schweitzer wondered. What can be the source of the gasses of decay? In the year 2000 Bob Harmon was eating lunch on a Hell Creek dig when he noticed a foot bone protruding from the cliffs above. This discovery led to the excavation of a 65 million year old T. Rex. The massive femur bone was eventually exhumed and plaster casted for helicopter removal from the remote road-less location. But the weight of the bone was too much for the helicopter. Reluctantly, the workers concluded that they had to cut the fossil in half. In the process small chips and cracked pieces were fractured off. Because of her relationship with the workers in Montana, Dr. Schweitzer was the recipient of these prizes.

Upon arrival Dr. Schweitzer noted that the animal bone fragments came from a pregnant T Rex. She understood this from the way certain bone layers are added during pregnancy in egg laying creatures. Next, she instructed her lab assistant to dissolve away some of the hard rock fossil formations to see what is left. That evening her assistant, Jennifer Wittmeyer, interrupted her at a taco party. "You aren't going to believe what has happened," she exclaimed. Racing to the lab the women examined what looked like a blob of red bloody connective tissue.

In the months and years to follow Dr. Schweitzer has ruled out nearly all the objections. She has discovered not only intact dinosaur tissue but even red blood cells in their intact blood vessels.

T. Rex red
blood cell

Here is the problem: Everything we know about tissue degradation tells us that tissue proteins will naturally breakdown to base chemicals in as little as 10,000 years. If that was not enough, the background radiation coming from the rocks would have totally destroyed any remnants within no more

than 100,000 years. This tissue was harvested from a fossil formation dated to 65 million years. Everything we know about how tissue degrades tells us this is totally impossible. And so the firestorm began against Dr. Schweitzer. Yet, in the years since her discovery she has slowly been eliminating all the objections. What she has discovered is authentic dinosaur soft tissue.

This is terribly troublesome. This seems to run amok with everything we know about the age of rock or everything we know about how animal tissue rots and returns to the earth. Let's look at the evidence and see if we can develop some preliminary conclusions:

1. The Hell Creek Formation fossil beds often smell like death. Can these gasses be the gasses of decomposition? They evidently are. Can this be going on for 65 million years? Not even a shred of possibility allows this to be true. The evidence points to a much younger date of the rock layers
2. Soft tissue, even intact red blood cells cannot last more than 50-100,000 years. Normal deterioration would destroy the tissue... even if it were encased and embalmed. The radiation from the surrounding rocks would utterly destroy any semblance of organic structures in 100,000 years. This rock is dated to be 650 times older than the maximum possibility.

What is the most likely conclusion from these findings? The dates we have been given for the rock layers is drastically in error. We know how tissues degrade. We can study this in real time in the present. We know the effects on organic chemical structures by background radiation over time. But do we really know how old these rocks are? What if the age of the dinosaurs was much more recent that we have been taught?

Now let's go back to the opening statement. Dr. Mary Schweitzer made the dinosaur discovery of the century and she did not want to tell anyone. Why would she not want to tell anyone? The answer is obvious. No one would believe her. It is impossible. It would call all of modern geology and our rock dating methods into question. It would give credence to those fringe scientists called creationists and their notion that the world is actually only about 6500 years old. They claim that most of the sedimentary rock layers we observe around the world, which have billions of dead things buried in them, are from a worldwide flood as described in the Bible. And that is exactly what this discovery strongly authenticates. Would you be open to hear more evidence? Coming to Missoula the weekend of April 6-9, 2017 is the Lake Missoula Creation Conference supported by many of the local Christian churches in Missoula and the Bitterroot Valley. This free conference is packed full of evidence like what you have just read. It just may be worth your time to come out and hear the other point of view. See www.LakeMissoulaFlood.org for more information on the conference.

Location: UM University Center Ballroom, 3rd Floor, Missoula, MT
