Passat Alltrack 140TDI with optional Luxury Package shown and Volkswagen Genuine Roof Bars, available at extra cost.

Exterior

The Passat Alltrack takes all the qualities that make the Passat great and adds a layer of ruggedness to make it the ideal companion for an adventure. Never shirking its European quality and precision, this is a vehicle built in every way to take on Australian conditions. Based on the MQB (Modular Transverse Matrix) platform, the Passat Alltrack combines wagon comfort with SUV versatility to spirit its occupants down a country lane, outback track or city highway.

With its contoured doors and 18" Kalamata Alloy wheels, the Passat Alltrack is every bit a Volkswagen when seen from side on. But viewed from the front, the vehicle reveals a striking new design architecture. Halogen headlights bracket a distinctive horizontal grille, while fog lights with static cornering function are there to light the way when visibility is compromised.

Body protection all around the vehicle further hints at its adventurous spirit. Underbody protection helps avoid unwelcome scrapes to the vehicle's underside. Aluminium-look scuff plates at the front and rear assist with steep approach and departure angles, while matte black protective trim, wheel arch extensions and lower body side mouldings add to the Passat Alltrack's bold look. Anodised silver roof rails are there when extra carrying capacity is required.

02 Rear taillight with 4MOTION badge

Passat Alltrack 140TDI with optional Luxury Package shown.

Interior

The Passat Alltrack's spacious interior mixes genuine comfort and functionality with plenty of visual appeal.

Featuring luxurious Vienna leather appointed seat upholstery[#] and a supportive ErgoComfort seat for the driver, the Passat Alltrack's level of refinement will surprise anyone sitting in it for the first time. The stylish leather multi-function steering wheel means an abundance of controls are readily at hand. Other touchpoints, such as the curved gearstick and infotainment system are a delight to use.

All around the cabin are hints that this is a Passat designed to take on the rough stuff. Alltrack lettering on the door sill inlays and centre console lid are an elegant reminder of the vehicle's capabilities, while aluminium-finish foot pedals and appealing 'Titanium' and 'Tracks' trim on the dashboard and doors add a touch of exclusivity.

Driver-comfort aids abound, such as 14-way electric front seats with driver's massage function. The driver's seat has a memory function which also remembers your door mirror position, select reverse and the passenger side mirror even dips so you see the kerb.

Rain-sensing windscreen wipers and automatically dimming rear-view mirror and driver's side mirror take away the glare of approaching high-beam lights.

Air Care 3-zone climate control air conditioning with air cleaning function and allergen filter keeps the cabin air clean and the temperature exactly to your specification. With Keyless Access and starting system technology, take the hassle out of opening and starting your vehicle.

You'll never be stuck for space when you load up the Passat Alltrack for your next escapade. Outstanding 639-litre luggage capacity (1769 litres with the seats folded) means you won't need to skimp on luggage, while a 40/20/40 split/folding rear seat configuration enables a variety of storage options. A partition net is a clever and practical way of separating cabin from luggage area.

[#]Leather appointed seats have a combination of genuine and artificial leather, but are not wholly leather.

Technology and Safety

Few vehicles can claim to feature as extensive a range of intelligent technology as the Passat Alltrack. Together, they make the Passat Alltrack a safer, more efficient and more responsive vehicle to drive.

Clever technology helps with running costs, too. The new, more-powerful TDI engine in the Passat Alltrack pairs with BlueMotion Technology, such as Start/Stop technology, Brake Energy Recuperation and Coasting function, to take the Passat Alltrack further with every tank of fuel.

A suite of safety features in the Passat Alltrack make it one of the safest vehicles on the road. Front Assist with City Emergency Brake (City EB)[^] uses radar sensor integrated in the front of the vehicle to monitor traffic ahead, while Manoeuvre Braking[^], front and rear assist the driver to avoid or reduce damage in a potential low speed impact by initiating emergency braking. Multi-collision brake is an invaluable tool that can help reduce the likelihood of a further collision once one has already taken place.

A range of driver aids make any drive as pleasurable as it is safe. Driver Fatigue Detection[^], for example, monitors the driver's input to warn them if they start to show signs of tiredness. Rear View Camera[^] (RVC Plus) with multi-angle views, Lane Assist[^] lane departure warning system, parking distance sensors front and rear and Adaptive Cruise Control (ACC)[^] are additional standard inclusions.

Infotainment finds its zenith in the form of the new-generation Discover Pro 9.2" infotainment system complete with smartphone glass appearance. Gesture Control allows the driver to navigate through various menus with a simple mid-air swipe of the hand, while passengers can use the new Media Control technology to select music and more via their smartphone or tablet.

Highlights

It's not often one comes across a large wagon that's as adept on dirt tracks as it is on city streets. No matter what your family's lifestyle needs, the Passat Alltrack has you covered.

Offering all the practicality of a wagon, but with outstanding off-road capability and rugged good looks to match, the Passat Alltrack is the ideal vehicle for a family escape.

A potent, 2.0-litre turbocharged TDI engine offers 140kW of power and 400Nm of torque, combined with Volkswagen's tried and tested 6-speed DSG transmission for assured power delivery. Even the most adverse road surfaces won't stop the Passat Alltrack, thanks to its sophisticated 4MOTION all-wheel-drive technology featuring the latest-generation electronically controlled multi-plate clutch.

Drivers can bolster the performance of their Passat Alltrack in tough conditions by selecting 'Off-road Mode' from the Driving profile selection, which allows you to adapt your vehicle to the prevailing conditions. Choosing this mode activates Hill Descent Control[^], adapts accelerator responsiveness and adjusts gear switching points.

The Passat Alltrack's off-road prowess is a given, but what makes it unique is the level of assured sophistication it brings to the mix. Whether used for work or for play, the Passat Alltrack combines class-leading refinement with the spirit of adventure to take you where you want to go.

Volkswagen Choice - Guaranteed Future Value

We are out to prove there are still some guarantees in life. We have developed Volkswagen Choice[^] - a flexible finance solution that provides you with the assurance of knowing exactly what the minimum value of your vehicle will be down the track. With Volkswagen Choice[^], you can enjoy your car without worrying about what the future will bring, providing peace of mind.

At the end of your term, you can simply choose to:

Trade-in

Your vehicle and re-purchase a new Volkswagen under Volkswagen Choice.

Retain

Your vehicle by paying or refinancing the Guaranteed Future Value amount.

Return

Return Your vehicle and, if it meets the agreed kilometre and fair wear and tear requirements[^], you will have no more to pay.

To find out more, go to <https://www.volkswagen.com.au/en/financial-services/guaranteed-future-value.html>

[^]The Volkswagen Choice Program consists of an option to return the vehicle to Volkswagen Financial Services (VFS)** at the end of the term and require VFS** to purchase the vehicle at an agreed price known as the Guaranteed Future Value or GFV as determined by VFS** and set out in your contract. At the end of the term, you can elect to: (1) trade-in the vehicle; (2) exercise the option to return the vehicle; or (3) retain the vehicle by paying the GFV. The GFV is not a representation by VFS** as to the likely market value of the vehicle as at the end of your contract. The option is available on new and demonstrator Volkswagen vehicles for selected models only. Please verify with your dealership the vehicles that are eligible for the program. The GFV will be reduced, and you will be liable for any loan contract deficit, if you exceed the nominated kilometre allowance and/or the vehicle is not in an acceptable condition in accordance with the Fair Wear and Tear Guide available at www.volkswagen.com.au. Other terms and conditions apply. The cost of the Volkswagen Choice Program is incorporated into the applicable interest rate. Please read the full terms and conditions. Please consider whether these products and services are appropriate for your circumstances. Before acting on any of the information on this page, please seek independent financial and tax advice. Full terms and conditions are available upon application. Available only to approved applicants of VFS**. Subject to credit assessment. Standard fees and charges apply. Fleet, government, rental buyers, hire car and chauffeur companies are excluded. Available at participating Volkswagen dealers. **VFS is a trading name of Volkswagen Financial Services Australia Pty Limited ABN 20 097 071 460. Australian Credit Licence 389344.

Glossary

4MOTION all-wheel drive

An all-wheel drive system that provides the best possible traction at all road speeds, in all weather and road conditions. An electronically controlled multi-plate clutch directs torque to the axle with the best traction.

When operating under a relatively low load or when coasting, power is primarily distributed to the front axle, thus saving fuel. However, the rear axle can be variably engaged in fractions of a second whenever necessary, even before any wheel starts to slip and therefore reducing the potential for a loss of traction. The wheels of the vehicle are prevented from spinning even when driving off and accelerating.

Activation of the multi-plate clutch is based primarily on the engine torque demanded by the driver. In parallel, a system within the all-wheel drive control unit evaluates such parameters as wheel speeds and steering angle.

Adaptive Cruise Control (ACC)

Adaptive Cruise Control (ACC) is an extension of the conventional cruise control system with advanced capabilities based on a radar sensor. When ACC is activated, the vehicle automatically brakes and accelerates to a speed and distance set by the driver.

If the Passat approaches a slower vehicle, the ACC brakes the car to the same speed and maintains the pre-selected distance. Even when a vehicle pulls into the same lane in front of you or slows, your vehicle is automatically decelerated to the pre-selected distance. If the vehicle ahead moves out of your lane, the Passat then accelerates up to the preset desired speed.

Deceleration of the vehicle may take place via intervention in the engine management system. If deceleration via engine torque is not sufficient, brake intervention takes place, braking the vehicle to a standstill if the traffic situation necessitates in vehicles equipped with a DSG transmission. ACC can be reactivated automatically by depressing the accelerator pedal. In vehicles fitted with a manual transmission, the system is automatically deactivated at speeds below 30 km/h and the driver is prompted to take charge by visual and acoustic signals.

The dynamics of the ACC system can be individually varied by selecting one of the driving programs from the driver profile selection.

Adaptive Cruise Control (ACC) cannot replace the driver's attentiveness. The driver is still legally responsible for the vehicle and must monitor the speed and distance in relation to other vehicles. The ACC system should not be used on winding roads or in adverse weather conditions such as heavy rain.

Anti-lock Braking System (ABS)

When braking, wheel speed sensors measure the road wheel speed and should one or more wheels start to lock the ABS system reduces brake pressure to that wheel. This prevents the wheels from locking during heavy or emergency braking, enabling the vehicle to remain steerable.

Anti-Slip Regulation (ASR)

ASR improves driving and steering characteristics by preventing the driven wheels from spinning under acceleration. When a difference in driving wheel speed is detected (i.e. when one wheel starts to spin due to differences in road surfaces, e.g. due to water or dirt) the system automatically reduces engine torque. ASR is a switchable traction control system.

Auto Hold Function

As soon as the vehicle comes to a complete stop, the ABS hydraulic unit stores the vehicles final braking pressure. So even when you take your foot off the brake pedal, all four wheels brakes remain applied, providing increased comfort in stationary traffic. This function is released automatically when you drive off again.

Brake Assist

During emergency braking, Brake Assist aids the driver by increasing the brake pressure automatically to a level exceeding the locking limit. The ABS is thus quickly brought into the operating range, which enables maximum vehicle deceleration to be achieved.

Direct Shift Gearbox (DSG)

DSG is a manual gearbox in which the gearshifts are controlled electronically. What makes the DSG unique is that it has 2 separate gear sets operated by 2 clutches.

The benefit of 2 gear sets and 2 clutches is that one gear set and clutch is engaged driving the vehicle with the second disengaged clutch having already pre-selected the next gear awaiting for power to be transferred. As the next gear has already been pre-selected prior to power being applied, the gear change only takes 3-4 100ths of a second. There is virtually no interruption to power, traction or acceleration.

The DSG also offers Tiptronic gear selection and sports mode.

Glossary

Driving Profile Selection

Driving profile selection provides the driver with a wide-ranging choice of settings that can be made to the vehicle according to the driver's preferences. The driver has the option of choosing between the following driving profiles: Normal, Sport, Eco and Individual. The Normal profile offers a comfortable but dynamic driving style. Sport provides faster response of the accelerator pedal and steering while the DSG switches to Sport mode. Eco mode has been designed to enhance fuel efficiency by including coasting function (with DSG) and by adapting engine performance, earlier gearshift points and consumption-optimised control of the air conditioning system. The Individual setting allows the driver to separately set various parameters including steering, engine, Adaptive Cruise Control (ACC) and air conditioning.

Coasting Function

While driving, as the driver's foot is taken off the accelerator pedal the engine is declutched, allowing the vehicle to coast and roll over a longer distance. The momentum of the vehicle is used to save fuel with a foresighted driving style. When the brake, accelerator pedal or the gear selector lever is operated, the clutch is re-engaged and engine braking / drive takes effect. Coasting Function can be selected or deselected via the multifunction display settings. The gear selector lever is required to be in the D position to be functional.

Electronic Brake-pressure Distribution (EBD)

Electronic, more sophisticated means of regulating the ratio of front/rear brake pressure. Settings are varied according to driving and load conditions to ensure each wheel is braked to the optimum extent.

Electronic Differential Lock (EDL)

EDL improves driving and steering characteristics when accelerating on road surfaces where each wheel has a different degree of traction. The system operates automatically and is combined with the ABS system. Using the ABS wheel sensors, EDL monitors the speed of the individual driving wheels. When a difference in driving wheel speed is detected (i.e. when one wheel starts to spin due to differences in road surfaces, e.g. due to water or dirt) the system brakes the spinning wheel, transferring engine power to the wheel with the best traction.

Electronic Stabilisation Program (ESP)

ABS and ASR traction control systems are integrated into the Electronic Stabilisation Program (ESP). In short, ESP helps ensure that the vehicle goes where you steer it even in extreme driving conditions. The ESP system constantly compares the actual movement of the vehicle with pre-determined values and should a situation arise where the vehicle starts to skid, ESP will apply the brakes to individual wheels and automatically adjust the engine's power output to correct the problem. ESP prevents the vehicle from losing control when trying to avoid an accident, for example. It also reduces the effects of understeer or oversteer.

Extended Electronic Differential Lock (XDL)

XDL is an extension of the Electronic Differential Lock (EDL) function. When cornering, XDL responds to the load relief at the front wheel on the inside of a corner. The ESP hydraulics are used for the XDL to apply pressure to the wheel on the inside of the corner in order to prevent wheel spin. This improves traction and reduces the tendency to understeer. As a direct result of the one-sided and precise braking pressure, cornering is sportier and more accurate.

Driver Fatigue Detection

The driver Fatigue Detection system automatically analyses the driving characteristics and if they indicate possible fatigue, recommends that the driver takes a break. The system continually evaluates steering wheel movements along with other signals in the vehicle on motorways and others roads at speeds in excess of 65 km/h, and calculates a fatigue estimate.

If fatigue is detected, the driver is warned by information in the Multi-function Display and an acoustic signal. The warning is repeated after 15 minutes if the driver has not taken a break.

Driver Fatigue Detection cannot replace the driver's attentiveness. The driver is still legally responsible for the vehicle and therefore determining whether or not they are fit to drive. A driving time of 15 minutes is required in order to assess the driver correctly. The functionality of the system is restricted given a sporty driving style, winding roads and poor road surfaces.

Glossary

Front Assist with City Emergency Brake (City EB) function

The Front Assist ambient traffic monitoring system uses a radar sensor to detect critical distance situations and thus help to shorten the braking distance, reducing the risk of a rear-end collision.

The traffic ahead is monitored constantly by the radar at the front. If a vehicle is detected ahead of you in the lane, the distance and the speed relative to it are calculated. If the gap is closing too fast, Front Assist initially warns the driver by means of an audible as well as a visual signal. At the same time, the brake pads are brought into contact with the brake discs and the sensitivity of the Brake Assist is increased. This primes the braking system for a possible emergency stop. Furthermore, an automatic jolt of the brakes warns the driver of the danger. If the driver also fails to react to the warning jolt, Front Assist brakes automatically, helping to avoid a collision or reduce the severity of the accident.

The City Emergency Brake (City EB) function is a radar based emergency braking system designed to help a driver avoid a low-speed crash or to reduce its severity. At vehicle speeds up to 65km/h, City EB monitors the area ahead of the car for vehicles which might present a threat of collision. If a collision is likely, City Emergency Braking first pre-charges the brakes and makes the emergency Brake Assist system more sensitive: if the driver should notice the risk, the car is ready to respond more quickly to their braking action. However, if the driver still takes no action and a collision becomes imminent, City Emergency Braking independently applies the brakes very hard. If the driver intervenes to try to avoid the accident, either by accelerating hard or by steering, City EB will deactivate and allow the driver to complete the avoidance manoeuvre.

Front Assist with City Emergency Brake (City EB) cannot replace the driver's attentiveness. The driver is still legally responsible for the vehicle and must monitor the speed and distance in relation to other vehicles.

Manoeuvre braking

Manoeuvre braking assists the driver to avoid or reduce damage in a potential collision by initiating emergency braking. It supports the driver during forward and reverse manoeuvring in a speed range of a maximum 10 km/h. If the risk for an accident is recognised, emergency braking is initiated to minimise possible damage.

Manoeuvre braking cannot replace the driver's attentiveness. The driver is still legally responsible for the vehicle. The object must be detected by the sensors. If the driver notices a risk that pedestrians, other vehicles or objects could be damaged they need to react accordingly and stop the vehicle.

Multi-collision Brake

The multi-collision brake has been designed to provide effective assistance for the driver in the moments after an accident. Multi-collision brake triggers automatic controlled braking once an initial collision has been detected so as to reduce the intensity of further accidents after a collision and can help prevent follow-on collisions with oncoming traffic.

The triggering of the multi-collision brake is based on a collision being detected by the airbag sensors. The ESP control unit limits the deceleration of the vehicle by the multi-collision brake to a defined value and vehicle speed. The vehicle can still be controlled by the driver, even when automatic braking is taking place. The driver can interrupt the multi-collision braking at any time by accelerating or braking even more strongly.

Lane Assist

Lane Assist is a lane departure warning system that is designed to help reduce the likelihood of the vehicle leaving the road or crossing into an oncoming lane and therefore the risk of accident as a result of driver distraction or a lapse in concentration.

The Lane Assist system monitors the road ahead with the aid of a camera (located near the interior rear-view mirror) which recognises lane markings and evaluates the position of the vehicle. If the vehicle starts to leave the lane, the Lane Assist system takes corrective steering action. If this is not sufficient the driver is warned about the situation by a steering vibration and is asked to take over the steering. Additionally, if no active steering movements by the driver are recognised for longer than approximately 8 seconds, a message will appear in the Multi-Function Display in conjunction with a warning tone. The corrective steering function can be overridden by the driver at any time and the system does not react if the turn indicator is set before crossing a lane marking.

In combination with Side Assist, the two assist systems complement each other. If another vehicle is in the blind spot during a lane change, the dual assist system warns the driver by means of flashing LEDs in the right-hand or left-hand exterior mirror and by vibrations on the steering wheel. It also supports the driver by means of a corrective steering intervention. This procedure occurs regardless of the state of the turn indicators.

Lane Assist cannot replace the driver's attentiveness. The driver is still legally responsible for the vehicle and therefore staying in the lane at all times. The system will not work if there are no recognisable lane markings. The camera vision can be reduced by rain, snow, heavy spray or oncoming lights. This and vehicles in front of you can lead to the lane markings not being recognised by the Lane Assist system. The Lane Assist system does not activate at a vehicle speed of less than 65km/h.

Glossary

Side Assist with Rear Traffic Alert

Side Assist, is a lane change assistant that detects vehicles on the right and left hand side of the lane, in the blind spot and those vehicles coming nearer behind. The system informs with a warning light in the exterior mirror whenever a detected vehicle is close and a lane change would be dangerous. If the driver sets the indicator, the warning light begins to flash.

Rear Traffic Alert warns the driver of approaching traffic at the rear of the car when reversing via an audible warning followed by a visual message in the Optical Parking System (OPS).

Park Assist*

The third generation Park Assist system actively helps the driver when entering or reversing into 90° parking bays, as well as reversing into and driving out of parallel parking spaces. The system works by using sensors mounted either side of the front and rear bumpers together with parking distance sensors front and rear. To park, the driver simply presses the Park Assist button to select the type of parking manoeuvre and uses the appropriate indicator as the car slowly passes the potential parking space. Sensors scan the size of the parking space as the car is driven past and the driver is alerted if the parking space is big enough. If there is sufficient space, the driver stops the car, selects the correct gear and lets go of the steering wheel.

Park Assist will alert the driver of the intended path and subsequently the appearance of obstacles in the Multi-Function Display, within the driver's field of vision. Park Assist then actively supports the driver by taking over the steering control and parks the vehicle in the available space using the ideal course, if necessary with several moves. The driver can however take over the control of the steering at any time and end the automatic parking procedure.

Park Assist cannot replace the driver's attentiveness. The driver is still legally responsible for the vehicle. If the driver notices a risk that pedestrians, other vehicles or objects could be damaged or if they are uncertain of the risk, they will need to react accordingly and stop the vehicle, ending the function.
