

Softening Inner Edge Binding

What?

When the dispersal or alignment valve is misaligned, the portion of the soul layer into which the chakra stream is attempting to release at the dispersal valve or enter at the alignment valve may experience unnecessary stimulation. This causes a blow back against the inner edge of the soul layer and a hardening of a special membrane located there, called the inner edge binding.

Why?

This type of hardening can spread out across the inner edge of the soul layer and cause a region of this powerful hub to no longer really function properly. Losing functionality here is serious as so many parts of the subtle anatomy travel through it and anchor there. Other parts of the anatomy are unable to attach there and fulfill their normal functions, as long as this hardening persists. There is a kind of deadening of the subtle reflexes of the hardened structure that doesn't allow for the connection and cooperation critical to the smooth functioning of the HES. Because other anatomy may be negatively impacted by this malfunction it is important to remember to check and reconnect into the inner edge of the soul layer any dropped connections such as: tethers, strands, guidewires, or other compromised pieces like elimination wheels at the rim. You will need to review all the different parts of the anatomy in different systems that attach there.

How?

People experience these problems in different ways. But the most prevalent is an agitated state of being resulting in irritation, crankiness and a general dissatisfaction with life; most especially in the area of life directed by the chakra affected. Physically, it can affect the nervous system, the digestive system and the elimination system causing maladies of agitation like colitis, tremors, or even chronic constipation. The relief of the alignment or dispersal valve correction

may have a very physical benefit and the further repair of the inner edge binding can be a great relief.

The “containing membrane” in the inner edge of the soul layer is called the inner edge binding because it strongly holds the inner edge hub in place while it stands up to the rapidly moving energies of the soul layer. In the case of a malfunction like a valve misalignment, the inner edge binding stretches to accommodate the misaligned soul pathway entrance at the alignment valve or as it is departing as dispersal valve.

Sacred Anatomy Energy Medicine Alignment

Softening Inner Edge Binding

This alignment is only necessary accompanying a valve misalignment

1. Apply the Edge Practice and with permission determine the need to align the inner edge binding.
2. Determine where the inner edge binding is hardened. It will be the same chakra that required the valve alignment correction. Determine if it is the alignment or dispersal location that needs this alignment or both.
3. Direct the energy: *Soften Binding (pale green with with sparkles)* into the location of the hardened inner edge binding.
4. If it is refusing to soften, use *Surrender* to begin a softening process but only use it sparingly because *Surrender* is so powerful it can damage as well as support a needed breaking through. Return to bringing in *Soften Binding* ASAP.
5. Monitor until binding is returned to a softened state.
6. Slather with *ULL*
7. Bring in any *Replenishing Energies* needed.
8. Bring in *Harmonizing the BOL* (inner edge and inner edge binding are BOL anatomy). *Harmonizing Blend* (to replenish the hubs)
9. Bring in *IBWSIB*
