REVISION LOG

REV	DATE	APP'D	CHANGE
–	12-08-98	KCL	Baseline release
A	06-17-99	KCL	Update pages 2-1, 2-7 – 2-10, 5-5, 9-9, header and grammar, changed Dwg revisions as indicated.
B	09-18-00	EDJ	Moved page 9-11 to 9-16. Added pages 9-11 to 9-15. Corrected page 9-4 and 9-7 for Bendix letter description. Updated OAT probe kit P/N's. Changed page iv for Dwg # 4028-A45 to include Garmin 430/530. Page vi changed to include Dwg # 4028-B98. Changed page 2-1 to adjust OAT tolerance. Changed page 2-3 to add labels 234 and 235. Change 2-4 and 2-5 to include Mk VI and VIII EGPWS models. Changed page 5-4 to add Sandel heading source. Page 5-1 changed by inclusion of TSO compliance paragraph. Inserted page 3-2 STC.
C	11-01-00	KCL	Added sections 2.8 and 2.9. Updated sections 1.4, 2.0, 5.1, 5.7 and 9.2. Moved section 9.0 to page iii. Moved page 9-16 to 9-21. Updated Dwg # 4028-A47.
D	06-27-02	EDJ	Updated section 1.3 system figure. Added P/N 681201 OAT probe installation and parts list to page iv drawing list. Updated Page 2-4 ARINC Table. Corrected page 10-3 Table 2. Added pages 9-21 to 9-26. Page 9-21 became 9-27.
E	04-12-05	ZK	Removed P/N 681201A-1 OAT Probe Assembly Kit, Loop-back procedure SW Version 93.00.79. Updated pages 2-1, 2-12, 5-2, section 9 and section 11. Changed company name.
F	09-19-05	CB	Updated install kit IK9630A-1, Dwg # 4028-395. Updated Section 1.3 system figure and sections 5.1 and 5.2. Fixed typo in section 2.6.2.
G	12-08-05	CB	Updated Company logo and install kit IK9630A-1
H	04/24/08	EDJ	Updated all sections with P/N 962830A-1(A), -2(A), & -3(A), updated Section 2.2, 2.5.2, 2.5.3, 2.7, 3.0, 5.1, and 9.0. Added Antonov and Yak-40 SSEC information in Section 2.6.4.
J	07/18/11	ZK	Updated 4028-B98 Rev D and 681201-1 Rev H parts list. Fixed tabs on page 1-1 so that it doesn't get corrupted when creating a pdf. Replaced missing Table 4 – MACH Tolerance and updated all of section 2 to compensate for the added page. Corrected the Table numbers and descriptions in section 9. Updated the table of contents to reflect all the changes.

The information in this manual is subject to change without notification. To ensure complete and current updates, note the Revision Log above and call Technical Assistance for updated information.

1.0 OVERVIEW**1.1 The Manual**

This manual is designed to facilitate the installation of the Shadin Fuel/Air Data Computer (ADC 2000).

1.2 Product Information

The Shadin ADC 2000 system is designed to provide a **combined** source of fuel and Air Data. Listed below are the navigational systems that the ADC 2000 has been designed to be compatible with.

Receives Serial Data from:Magellan

Skynav 5000

ARNAV

STAR 5000

FMS 7000

R5000

Trimble

2000/2000A

2100/3000

Bendix King

KLN90

KLN90A

3100/2101 KLN90B

KLN89/89B

KLN900

Garmin

150, 155, 155XL, 165

230, 230XL

300, 300XL

430, 530

BFGoodrich

Pronav LNS 6000

IIMorrow

611, 612, 618

NMS 2001

800, 820, 360

GX50, 55, 60

Transmits Serial Data to:

ARNAV

Magellan

Bendix/King

Trimble

Garmin

Note: To find out which particular receiver models have AIR DATA receive capability, contact the manufacturers.

Transmits ARINC Data to:ASINC

Airshow

Bendix King

EFIS 40/50

Honeywell

SPZ-5000

Universal

UNS-1M

Data Nav III

Global

GNSX

GNS-Xls

Trimble

TNL8100

IIMorrow

2101

Page: 1-2

1.3 System Configuration

The Fuel/Air Data system is a remote mounted computer, which is connected to the GPS receiver via serial data. It is also connected to the pitot and static line, OAT probe, fuel flow sensors, altimeter barometric pressure potentiometers and the aircraft heading source.

INSTALLATION MANUAL

FUEL/AIR DATA COMPUTER

P/N 962830A-1(A), 962830A-2(A), 962830A-3(A)

Page: 1-3

1.4 Fuel Totalizer Configuration

Shown below is an optional system configuration utilizing a Shadin Fuel Flow Indicator. Note that the only navigational receivers supported in this configuration are the Bendix/King KLN series and the Garmin 430/530. Consult Drawing Number 4028-A60 contained in this manual for installation information on the Bendix/King KLN series. Consult Drawing Number 4028-B98 for installation information on the Garmin 430/530.

1.5 F/ADC2000, Argus Moving Map Configuration

Shown below is the system configuration that supports output to an Eventide Argus moving map using the Shadin serial to serial data converter P/N 937000-03. The fuel and AIR DATA are displayed on the Eventide-Argus moving map. Consult Drawing numbers 4070-005 and 4028-A61 contained in this manual.

2.5.2 ARINC 429 Labels Associated with Switch Settings

In Table 5 – ARINC Label Configuration below, the heading row containing the numbers 1-A indicates the setting of the ARINC rotary switch on the back of the unit. The number in the cell at the intersection of an ARINC switch setting and an ARINC label number is the repeat time in msec for that label. Zero indicates that the label is not generated with that switch setting. Tolerance on the rate is $\pm 10\%$ averaged over one second.

LABEL	Description	0	1	2	3	4	5	6	7	8	9	A

Page: 2-8

2.6 Limitations**2.6.1 Warm-up time**

The Fuel/AIR DATA System requires a warm-up time that varies with ambient temperature:

70°C ambient	5 minutes warm-up required
15°C ambient	10 minutes warm-up required
-20°C ambient	15 minutes warm-up required
-40°C ambient	20 minutes warm-up required

If the ADC has been configured for a fuel flow delay, fuel flow and thus fuel used information shall be unavailable at startup for the duration of the selected delay.

2.6.2 Supplemental equipment

All Shadin F/ADC(s) and ADC(s) are not designed to replace factory installed AIR DATA fuel flow systems or other gauges. They are not intended to be used as a primary system to drive altimeters or airspeed indicators. The F/ADC fuel section is not a fuel quantity system and therefore reports only what was manually entered by the operator.

**2.6.3 Static Source Error Correction (SSEC),
Pitot Source Error Correction (PSEC)**

For certain models of aircraft, the Fuel/AIR DATA System will make corrections to pressure altitude by compensating for static source error. For some of these models, the Fuel/AIR DATA System will make corrections to indicated airspeed by compensating for pitot source error.

The System does not provide true and absolute readings for all circumstances. It makes no altitude corrections when the uncorrected IAS is below 100 knots, and it makes no airspeed corrections when the uncorrected IAS is below 150 knots. It does not account for other factors, such as the current useful weight, that contribute to static source error and pitot source error. Rather, the Fuel/AIR DATA System performs calculations based solely on indicated airspeed and pressure altitude. The SSEC / PSEC corrections were derived from specific aircraft data referred to in section 2.6.4. To configure the Shadin F/ADC for a specific aircraft model refer to section 9.

2.8 Electrical Interface Specifications

The specifications for the interfaces heading, fuel flow and baro are listed in this section.

2.8.1 Heading Interface

The heading interface follows the ARINC 407 standard (line voltage of 11.8 Vrms).

Synchro Leg	Input Impedance
H	10 kohm
X	17 kohm
Y	17 kohm

2.8.2 Fuel Flow Interfaces

There are three basic types of fuel flow interfaces supported. The interface type is defined in the ADC2000 part number. Refer to section 2.7 for the part numbering scheme.

If the fuel flow interface is not used, connect the signal inputs together and then to airframe ground. Do not tie-off transducer excitation (TXDR, PWR), leave this/these output(s) open or floating.

2.8.2.1 Digital Fuel Flow Interface

There are two possible installations for the digital fuel flow interface, the first is that the ADC is connected to a dedicated fuel flow transmitter, and the second is that the ADC is connected into a fuel flow system.

Dedicated Transmitter

Fuel Flow Interface Input Impedance	47 kohm
-------------------------------------	---------

Shared Transmitter

Under normal operating conditions the voltage swing (the signal amplitude) can be calculated using $V_s = [R/(R + 47\text{ k})] * 5\text{ Vdc} - 0.5\text{ Vdc}$, where R is the input impedance of the aircraft fuel flow indicator.

For example with an input impedance $R = 1\text{ Mohm}$, the voltage swing $V_s = 4.27\text{ Vdc}$

When the fuel flow information is encoded in frequency and not amplitude, the loading effects do not produce an error, provided the aircraft indicator can detect the signal transitions.

INSTALLATION MANUAL**FUEL/AIR DATA COMPUTER**

Rev: J

P/N 962830A-1(A), 962830A-2(A), 962830A-3(A)

Page: 2-15

2.8.2.2 Sine Wave Fuel Flow Interface

The interface source signal amplitude varies with frequency. Listed in the table below are the input impedance vs. peak to peak input voltages of the ADC2000 under normal operating conditions.

Input Impedance	Input Voltage
2 Mohm	Input voltage less than or equal to 1.0 Vpp
24.5 kohm	Input voltage greater than 1.0 Vpp

Maximum Input Voltage 10 Vpp

2.8.2.3 DC Voltage Fuel Flow Interface

The DC voltage fuel flow interface has a differential input. The specifications under normal operating conditions are listed below.

Positive input greater than 100 Mohm
 Negative input greater than 100 Mohm

Maximum Input Voltage 10.2 Vdc

2.8.3 Baro Interface

The baro interface requires a three-wire connection to the potentiometer housed in the aircraft altimeterⁱ. The three connections are the high side, low side and wiper. The specifications under normal operating conditions are listed below.

Input Impedance high side greater than 100 Mohm
 Input Impedance low side greater than 100 Mohm
 Input Impedance wiper greater than 100 Mohm

Maximum Input Voltage ± 12 Vdc

ⁱ The altimeters supported are listed in section 9.2 and are dependent upon the ADC2000 software version level.

4.0 PLACING AN ORDER

Please know the aircraft year and model number, its serial number, and the engine make and model number when you call to place orders. Information on the fuel flow system previously installed in the aircraft and any communication interface (RS-232, RS-422 and ARINC 429) information may also prove useful.

We may request a wiring diagram of the aircraft's fuel flow system and transducer and/or K-factors.

When interfacing an altimeter to the Shadin barometric pressure potentiometer option, consult the list of supported altimeters contained in this manual or contact Shadin Technical Support.

INSTALLATION MANUAL**FUEL/AIR DATA COMPUTER**

Rev: J

P/N 962830A-1(A), 962830A-2(A), 962830A-3(A)

Page: 5-1

5.0 INSTALLATION PROCEDURE**5.1 General**

The conditions and tests required for TSO approval of this article are minimum performance standards. It is the responsibility of those installing this article either on or within a specific type or class of aircraft to determine that the aircraft installation conditions are within the TSO standards. TSO articles must have separate approval for installation in an aircraft. The article may be installed only if performed under 14 CFR part 43 or the applicable airworthiness requirements.

All work must conform to AC 43.13-1B; latest release.

5.2 F/ADC Location Selection

The Fuel AIR DATA Computer should be mounted in a dry, temperature stable location with enough distance from motors, pulse generating equipment, relays and cables carrying high DC or AC current to avoid interference with low level signals of the OAT and fuel flow.

The equipment may be installed in non-pressurized and non-controlled temperature location.

In considering the location, keep in mind that the F/ADC requires signals from the fuel flow, the OAT probe, heading system and the pitot and static lines. Placement in the front section of the aircraft is favorable, in order to avoid running all of these signals to the tail of the aircraft.

5.3 Mounting the F/ADC

Consult the Drawings 4028-617 or 4028-618 or 4028-619 and Drawing 4028-395, Before mounting the ADC2000. Use the recommended hardware. Any orientation is acceptable. Make sure that the computer is not the lowest point in the pitot and static system, to reduce the chances of collecting moisture or water in it. Form a water trap, if necessary.

P/N 962830A-1(A), 962830A-2(A), 962830A-3(A)

Page: 5-2

5.4 Mounting the OAT Probe

1. Refer to Drawing 4028-005 and OAT Probe Assy Kit P/N 681201-1. Use the supplied stiffener to support the probe. Keep the probe away from transmitting antennas and static ports of autopilots to void interference.
2. Refer to drawing 4028-A45. The OAT probe power is supplied from (red wire) J1:52. The OAT signal is the white wire from J1:33. At least the signal wire to the ADC2000 should be shielded and terminated at the ADC2000 only.
3. The sun shield must be installed for proper indication of OAT.
4. For single engine installation, avoid mounting the OAT probe on the belly of the aircraft to avoid erroneous reading due to the presence of hot exhaust gases.
5. Below is an OAT °C to input current conversion chart for use in testing the OAT Probe.

OAT °C	Input μ A		OAT °C	Input μ A		OAT °C	Input μ A		OAT °C	Input μ A
-60	213		-20	253		+20	293		+60	333
-50	223		-10	263		+30	303			
-40	233		0	273		+40	313			
-30	243		+10	283		+50	323			

1°C = 1 μ A

Page: 5-3

5.5 Connection to the Fuel Flow Sensor

1. If the aircraft is not equipped with a fuel flow source, refer to the STC covering the installation of the fuel flow transducer on the engine.
 2. When connecting to any fuel transducer, Shadin recommends using a 3 conductor, 22 gauge, shielded wire with the shield terminated at the AIR DATA only.
 3. Note that for single engines all fuel flow types should use left side inputs only.
 4. *Install the transducers according to the engine STC, using Drawing 4028-A46 to connect the fuel flow transducer to the computer.
 5. *If the aircraft is equipped with a digital fuel flow system using transducer (P/N 680501), use Drawing 4028-A46 (**refer to note 1 on that drawing**) and the STC drawing covering the installation.
 6. Before hooking to an existing fuel system in a turbine or jet application, consult all installation drawings contained in this manual.
 7. *If the aircraft is equipped with a DC fuel flow system, use Drawing 4028-A46 (for P/N 962830A-3(A)) and the STC covering the installation.
 8. *If the aircraft is equipped with a sine wave pickup coil type of fuel flow transducer, use Drawing 4028-A46 (for P/N 962830A-2(A)).
 9. Make sure that the system is initialized with the proper transducer K-Factor for a digital or sine systems and with the proper airframe make and model for the DC fuel flow systems. See the attached tables in section 10.0.
- * Consult section 11 for specific aircraft installation wiring drawings.

5.6 Connection to the Heading Source

The system is designed to interface with any ARINC-407 heading system (X, Y, Z) with no effect on the heading system or the bootstrap.

XYZ Heading ARINC 407	FUEL AIR DATA J1	Collins 328A-2A 2P1	Collins HSI331A P1	Collins MCS 65 P1	Collins 328A-5	King KI525A P2	King KSG105 P1	Sperry Gyrosyn Comp. P1	Sigma- Tek DG	Sandel SN3308	
										P1	P2
X	7	11	S	25	32	s	t	L	A		25
Y	2	4	T	40	22	v	p	M	B		6

5.7 Connection to the Pitot and Static Lines

The pitot static line should be cut and a tee installed to tap into these lines. Use the appropriate type of fittings to match the type installed in the aircraft. Refer to CFR part 43, appendix E for approved practices in installing and verifying these connections.

PITOT/STATIC adapter helpful hints

To make an adapter for the Shadin ADC2000, the following parts could be used. It is recommended to use all aluminum fittings.

Existing Pitot/Static lines → AN910-1D → AN816-2D → #2 Hose(with female fittings)

AN910 DASH NUMBER		PIPE SIZE
BRASS	ALUM. ALLOY	
-1	-1D	1/8"
-2	-2D	1/4"
-3	-3D	3/8"
-4	-4D	1/2"
-6	-6D	3/4"
-8	-8D	1"

AN816 DASH NUMBER		TUBE O. D.	PIPE THREAD
STEEL	ALUM. ALLOY		
-2	-2D	1/8"	1/8"
-3	-3D	3/16"	1/8"
-4	-4D	1/4"	1/8"
-5	-5D	5/16"	1/8"
-6	-6D	3/8"	1/4"
-8	-8D	1/2"	3/8"
-10	-10D	5/8"	1/2"
-12	-12D	3/4"	3/4"
-16	-16D	1"	1"

MS20825 TEE		TUBE O. D.	PIPE THREAD
STEEL	ALUM. ALLOY		
-2	-2D	1/8"	1/8"
-3	-3D	3/16"	1/8"
-4	-4D	1/4"	1/8"
-5	-5D	5/16"	1/8"

HOSE: Stratoflex 193-2 or Aeroquip 306-2 with MS27404 (P/N 311-2D) on each end.

Page: 5-6

5.8 Connection to the Navigation Management System

1. Use installation wiring diagram 4028-A45 to connect the Fuel AIR DATA Computer's Connector J1 to the navigation management system.
2. A 2 amp. circuit breaker should be used for powering the system. Mark the circuit breaker by engraving, painting or other approved method.
3. Keep the cables away from power cables, DME and transponder cables.
4. Refer to the specific Nav Receiver Installation Manuals for details.
5. If the ARINC 429 output is used, refer to the digital EFIS or flight management installation manual and sections 2.5.2 – 2.5.4 in this manual.

5.9 Connection to the Altimeter Baro Pot (optional)

1. Use the Installation wiring diagram 4028-A47 to connect the altimeter to J1 of the AIR DATA computer.
2. Remember to select the correct altimeter type in the software configuration. See section 9 in this manual.

5.10 Post Installation Checkout

1. The pitot and static system must be checked for leaks.
2. Operate the Navigation Management System; select the altitude and airspeed pages. Use the static and pitot test system to check the accuracy of the readout in the Navigation Management System pages.
3. Select heading page. Slew compass through 360°. The error should be within $\pm 1^\circ$.
4. Select the OAT page. Compare to the reported ambient temperature. The error should be within $\pm 2^\circ\text{C}$.
5. Run the engines and select the fuel flow page. Compare the fuel flow readout with the engine manufacturer's fuel flow charts under the ambient temperature and pressure conditions.
6. Set the Barometric pressure to a known value and verify that the reported barometric pressure at the Navigational Receiver is that value ± 0.01 In.Hg. (if the option is installed)

6.0 OPERATING INSTRUCTIONS

1. Power the avionics DC buss and the Navigation Management System.
2. After the warm-up period, density altitude and PALT are available. IAS will be available but will be out of range until actual airspeed is available. Winds aloft will be available if the IAS is greater than 40 Kts and magnetic heading is within 40° of magnetic track.
3. Fuel Flow, Fuel Used, Fuel Remaining, Heading and OAT will be available after power-up.
4. Refer to the specific Nav Receiver Operator's Manual for page selection of various data.

7.0 INITIALIZATION

1. The system requires initialization of K-factor for fuel flow transducers or aircraft model for DC fuel flow sensors. Refer to Table 1 **analog** for fuel flow and Table 2 or Table 3 for **digital or sinewave** fuel flow.
2. Refer to the specific Navigational Receiver Operator Manuals for the serial port set up.

9.0 CONFIGURING THE AIR DATA

Part number 962830A-X(A) (X= 1 or 2 or 3) AIR DATA Computer needs to be configured to program it for the particular installation. The procedure contained in this Installation Manual is for software versions 93.00.16 to 93.00.29, 93.00.51 to 93.00.71, 93.00.77, and 93.00.82 and above. There are two methods to accomplish this task. The first method is to follow the procedures as set forth in the 'ADSETUPF User Manual'. The second method is to manually enter the information by performing a 'Loop-Back' procedure.

9.1 Configuring with 'ADSETUP User Manual'

The ADSETUP User Manual is a configuration utility that allows setting the ADC configuration by running a program on a PC. The PC is connected to the AIR DATA via the serial communication port. See the 'ADSETUP User Manual' for more details.

P/N 962830A-1(A), 962830A-2(A), 962830A-3(A)

Page: 9-2

9.2 Configuring Manually (Loop-back)

The switches that are available from the back side of the unit need to be set to the appropriate positions as determined by the switch settings listed below. After the correct switch positions have been selected, the unit is powered using the 'Loop-Back' harness (consult drawing number 4028-A62 contained in section 11). The purpose of the 'loop back' harness is to tie the RS-232 transmit and receive ports together. This allows the software, when the unit is powered on, to read the switch positions. Switch 1 is set to different positions to select the separate stages that the loop-back is performing. There are 4 different 'loop-back' procedures. Use 'loop-back' procedure 1 for Software Versions 93.00.16-93.00.29. Use 'loop-back' procedure 2 for software versions 93.00.51-93.00.71. Use 'loop-back' procedure 3 for software versions 93.00.77. Use 'loop-back' procedure 4 for software version 93.00.82 and above. Note that procedure 1 has 2 stages. Procedures 2 and 3 have 4 stages and procedure 4 has 5 stages. Remember to cycle power between stages and that the F/ADC is to be powered on for 1 minute for each stage.

The following figure shows the approximate switch positions:

Page: 9-22

SELECT NO DELAY

Only under special circumstances should a fuel flow delay time other than “No Delay” be selected. Read the following paragraphs for a description of these special circumstances.

On a few aircraft installations which have digital fuel flow and use a very low K-factor (858 pulses per gallon), there has been a problem with the Air Data reporting a large jump in fuel used as well as a corresponding decrease in fuel remaining at engine startup. This is not considered to be a Shadin Air Data problem, but rather has been defined as an aircraft problem involving noise on the digital fuel flow signal.

A solution for this problem is to use the Air Data fuel flow delay feature. This feature suppresses the fuel flow (and its affect on fuel used and remaining) for a startup delay time each time the engine starts. Fuel flow delay time is selectable in the Air Data loop-back mode, with selections of 0, 5, 10, 15, 20, 25, 30, 35, 40, and 45 seconds delay available.

If a fuel flow delay is needed, start by reconfiguring the ADC to use a large delay (i.e. 45 seconds). If the large fuel flow mitigated the problem try reducing the delay until the problem returns. Then use the least amount of fuel flow delay that suppresses the problem.

When a fuel flow delay time is selected, the Air Data checks for fuel flow below 15 pph. If the fuel flow is below 15 pph, the Air Data considers the engine to be off and returns a fuel flow of 0. Then as soon as the fuel flow exceeds 15 pph, the Air Data continues to return a fuel flow of 0 until the delay time has expired. In a twin engine, the Air Data zeroes both fuel flows during the startup delay for each engine.

SPECIAL OPTIONS

Only under special circumstance should SPECIAL OPTION 1 be selected. Read the following paragraphs for a description of the special circumstance.

Because the IAS range on the AIR DATA computer is valid from 20 to 350 knots ARINC 429 labels 206 and 210 are transmitted with NCD status and stop being transmitted almost simultaneously if the IAS is less than 20 knots. In order to interface with certain avionics equipment which exhibit warnings if a valid IAS or TAS label is not received, SPECIAL OPTION 1 was implemented.

When the AIR DATA computer is configured with SPECIAL OPTION 1 the ARINC 429 labels 206 and 210 are transmitted with OK status and a value of zero knots if the actual IAS is less than 20 knots.

INSTALLATION MANUAL**FUEL/AIR DATA COMPUTER**

Page: 10-1

10.0 SETTING THE K-FACTOR

The process of setting the K-Factor is needed to match the F/ADC to the aircraft fuel flow system characteristics. To set the K-Factor into the F/ADC you must first determine whether it is an Analog, Digital or Sine Fuel Flow unit.

<u>P/N</u>	<u>FUEL FLOW TYPE</u>
962830A-1(A)	Digital
962830A-2(A)	Sine Wave
962830A-3(A)	Analog

Use the switch settings from the appropriate table to set the K-Factor.

For Digital or Sine units (P/N (s) 962830A-1(A) and 962830A-2(A)) use the Digital K-Factor Settings Tables.

Switch 1 & 2 selects the left K-Factor

Switch 3 & 4 selects the right K-Factor

Due to possible fuel flow system peculiarities, switch 1 & 2 and switch 3 & 4 do not necessarily need to be set to the same setting. For a one engine system, use switches 1 & 2.

For Analog units (P/N 962830A-3(A)) use the Analog K-Factor Settings Table.

Switch 1 & 2 selects the main engine K-Factor.

Switch 3 & 4 selects the offset.

The offset is simply the value represented by switches 3 & 4 in the Analog K-Factor Settings Table below. For example, if you wanted an offset of 0, the switch settings would be 0,0. If you wanted an offset of 416, the switch settings would be 0, 1. If you wanted an offset of 1094, the switch settings would be 0, 4.

Configuration is now complete.

ADC 2000 MS CONNECTOR

NOTES:

- 1 THIS SCHEMATIC IS USED FOR KNOWN BEECH KING AIR MODELS. SOME INDICATORS ARE NOT LISTED BUT MAY BE INTERFACED. CALL SHADIN TECH SUPPORT IF YOU DO NOT SEE THE PART NUMBER OF YOUR INDICATOR LISTED. INDICATOR PART NUMBERS POSSESSING A PREFIX OF "PC900-" ARE XOTECHNOLOGIES TYPE INDICATORS. THE LAST DIGIT REPRESENTS THE INDICATOR AUXILIARY RATE OUTPUT (1 NUMBER). SHADIN SUPPORTS THE "-1" MODELS ONLY.
- 2 XOTECHNOLOGIES INDICATOR P/N PC900-XAXXXXPH-XX0 IS NOT SUPPORTED. THE AUXILIARY RATE OUTPUT OF THIS UNIT IS 0-1 mA. INDICATOR P/NS THAT END WITH A "-XX2" WILL ENCOUNTER A DEGRADATION IN PERFORMANCE DUE TO THE AUX. RATE OUTPUT OF 0-5.333 VDC. INDICATOR P/NS ENDING WITH AN "*" ARE UNKNOWN.
- 3 THE FOLLOWING XOTECHNOLOGIES INDICATOR P/NS POSSESS A K-FACTOR KNOWN TO SHADIN:

PART NUMBER	K-FACTOR/OFFSET	AUX RATE OUTPUT	ADC200/2000 SWITCH SETTINGS			
			SW1	SW2	SW3	SW4
PC900-1A0600-XX1	38,460/0	0-5 VDC	0	4	0	0
PC900-1A0750-XX1	30,770/0	0-5 VDC	0	5	0	0
PC900-1A0800-XX1	28,850/0	0-5 VDC	0	6	0	0

- 4 THE FOLLOWING BEECH INDICATOR P/NS POSSESS A K-FACTOR KNOWN TO SHADIN:

PART NUMBER	K-FACTOR/OFFSET	ADC200/2000 SWITCH SETTINGS			
		SW1	SW2	SW3	SW4
90-380009-2	77,000/416	0	0	0	1
90-380009-5	77,000/416	0	0	0	1
101-384153-1	30,777/0	0	5	0	0
101-384153-3	30,777/0	0	5	0	0

- 5 THE J1 CONNECTOR OF THE ADC 200 AND ADC 2000 HAVE THE SAME FUEL FLOW PIN LOCATIONS.
- 6 THE PIN LOCATION OF THE ADC 2000 W/MS CONNECTOR OPTION IS THE SAME FOR ALL MODELS POSSESSING THE MS CONNECTOR OPTION.
7. USE SHIELDED WIRE BUT GROUND ONLY ON ADC UNIT END TO PREVENT A GROUND LOOP.
