Suicide is a devastating event, with a web of causality encompassing social, emotional, environmental and other health factors. In Alaska, the suicide rate is almost twice the US National suicide rate, with even more disproportionate statistics reported from Native Alaskan communities (Figure 1).1

Similarly, high rates of suicide exist across the Arctic2 where remote indigenous communities are adapting to the social, political, economic, and environmental changes that characterize rapid modernization. Many of these communities have also experienced historical trauma through early interactions with Western cultures. These pressures, and the myriad ways in which they impact access to resources and the perceived future prospects of young people, are manifest in the health disparity of Arctic indigenous youth suicide.3,4

The US Arctic Research Commission coordinates the Arctic Mental Health Working Group (AMHWG), which aims to work collaboratively with tribes, healthcare providers, and other stakeholders to promote research on, and raise awareness of, the significant mental and behavioral health disparities that exist between Arctic and non-Arctic populations. As an initial focus, AMHWG has chosen to address suicide prevention in Arctic communities with a specific emphasis on early intervention approaches for children and youth.

Research has shown that early intervention and prevention programs are critically important in reducing the risk and occurrence of suicide.5,6 Promoting wellness, developing protective factors, and raising awareness of suicide risk factors are examples of early interventions that can provide support to individuals and communities before a crisis situation arises.5,6

To promote increased capacity and strengthened systems of care, AMHWG encourages the following research and activities:

1. **Collect, integrate, and analyze data to improve our understanding of the epidemiology of mental and behavioral health issues, including suicidality.**

   Effort in this area will improve communication among the various agencies addressing mental and behavioral health issues. Specifically, AMHWG will highlight how enhanced sharing of information and data will enable current health care systems to better identify and provide earlier assistance to those needing care. A focus on data collection at the community level also supports locally based actions, which can often be more effective. AMHWG will encourage improving information technology infrastructure to better support data integration and analysis and will support greater forensic review of suicides to further understand their epidemiology.

2. **Improve mental and behavioral health workforce capacity in Alaska.**

   An obvious and critical component of systems of care is a well-trained cadre of mental health care providers. AMHWG will encourage measures to ensure that there are a sufficient number of qualified individuals in rural communities available to assist with mental health and wellness promotion, prevention, and treatment. The working group will gather information on, and raise awareness of, the level of unmet mental health provider needs in rural Alaska. AMHWG will also promote research needed to understand and address the observed instability in this workforce.

3. **Strengthen mental health protective factors of children and youth with a focus on community-based efforts.**

   AMHWG will encourage research into the mental and behavioral health of children and youth, including family, cultural and community protective factors that support and enhance healthy development. Additionally, the group will emphasize the importance of community-based early intervention and follow-up support for children and youth at risk.
