Introduction

Dear Customer,

to start with, we’d like to provide you with some important information about your new pedelec. This will enable you to handle the technology better and to avoid risks. Please read the operation instructions carefully and keep them in a safe place for later reference.
The pedelec you have received has been assembled and adjusted according to your body type. If this isn’t the case, please contact a bike shop to have this necessary work done on your bike, or make sure that you carefully read the manufacturer’s assembly instructions and follow all of the steps included within.

It is assumed that the pedelec’s user has acquired the basic necessary knowledge to operate pedelecs.

Everyone that
• uses
• repairs or services
• cleans
• or disposes of this Pedelec

must completely acknowledge and understand the content and meaning of these operation instructions. If you have any further questions or have not quite understood certain points, you should contact a specialist pedelec retailer for your own safety.

This manual contains information about construction, technology, maintenance and servicing. Please take note of this information, as much of it is relevant to safety. Failure to consider this information can cause serious accidents and damage to property.

As modern pedelec technology is highly complex, we have chosen to only describe the most important points. As well as this, this manual only applies to the pedelec for which it was issued.

The technical details concerning the parts installed to the bike can be read in the attached instructions and reference materials provided by each of the bike’s manufacturers. If you are unsure about a particular point, please contact your specialist retailer.

Before riding your pedelec on public roads, you should inform yourself about the applicable national regulations in your specific country.

First, however, a few pointers which the person using the pedelec should consider before starting a journey:
• Always wear a fitted and suitable bicycle helmet and use it each time you ride.
• Read the instructions supplied by your helmet manufacturer relating to fitting the helmet properly.
• Always wear bright clothing or sportswear with reflective elements when you ride. If you are riding in difficult terrain, please wear suitable clothing, such as protective bike wear.
• Tight clothes and trouser clips are mandatory to wear. Your shoes should be slip-resistant and have hard soles.

Even if you are an experienced pedelec user, it is essential that you first read the chapter “Before your first ride” and then carry out all the important checks from the chapter “Before every ride”.

Please note that as a pedelec rider, you are particularly at risk on public roads.

Ensure that you protect yourself and others with responsible and safe riding.
The enclosed images show the standard commercial pedelec models. The pedelec you have purchased may look somewhat different. This manual describes pedelecs in the following categories: e-road bike, e-gravel bike, e-endurance bike. This instruction manual only applies to the pedelec mentioned on the envelope with which it was issued.
Safety Instructions

Please read all warnings and advice in this instruction manual carefully before using your pedelec.
Please keep the instruction manual in a safe place for later use. Keep it close to your pedelec so that you can access it at any time.
The manufacturer accepts no liability for damages resulting from non-compliance with these instructions. Your Pedelec must only be used in accordance with its intended use.
Any other use may lead to technical failures and accidents. Liability for defects and warranty will be void in case of improper use.

Please ensure you read the chapters “Before the first ride” and “Before every ride” before using the pedelec for the first time!

If you lend your pedelec to a third party, please give them this operating manual along with the pedelec.
This operating manual contains five different types of pointers – one providing important information about your new Pedelec and how to use it, a second referring to possible damage to property and the environment, and a third type warning against potential falls and serious damage, including physical injury. The fourth pointer helps you to apply the proper torque so the parts don’t loosen or break. The fifth pointer reminds you that it is necessary to study the operation and assembly manuals included carefully.
When you see these symbols, there is always a risk that the described danger may occur.

The text which the warning covers always has a grey background.

The warnings break down as follows:

- **Information**: This symbol provides information about how to use the product or highlights specific parts of the operating manual that are particularly important.

- **Warning**: This symbol warns of misuse which could result in damaging the product or the environment.

- **Danger**: This symbol indicates possible dangers to your health and life that could arise if specific actions or appropriate care is not taken.

**Important screw joint**: Precise torque must be applied here when tightening. The correct mounting torque is either displayed on the component or listed in the table of torques on page 39. In order to apply a precise torque, you must use a torque wrench. If you don’t have a torque wrench, please contact a specialist dealer. Parts which do not have the correct torque could fall off or break! This may result in severe falls.

**Operating Instructions**: Read all of the instruction manuals delivered with the pedelec. If you are unsure about any of the topics addressed in this handbook, contact your specialist dealer.
For your safety

This operating manual assumes that you have a basic knowledge of riding pedelecs/bicycles. It will not teach you how to ride a pedelec/bicycle. Likewise, it does not explain how to assemble or repair the pedelec.

Always be aware that pedelecs may give rise to risks, especially to riders themselves. Always be aware that you are not as protected as you are in a car, for example. Pedelecs have no airbag and no body. Nevertheless, you are faster and can ride on other areas of the road compared to a pedestrian. Pay particular attention to others on the road.

Never ride with headphones. Never use your phone while riding. Never cycle if you are unable to control your bike completely. Under no circumstances should you ride your bike if you have taken medicine or are under the influence of alcohol or drugs.

- Under wet and slippery conditions, adapt how you cycle accordingly. In this case, you should ride more slowly and brake earlier and more gradually, as the braking distance becomes significantly longer.
- Ride at an appropriate speed for the terrain and your riding capabilities.

Before the first ride

To ensure that you enjoy a safe and comfortable riding position, please allow your specialist retailer to set up your handlebars and stem. Adjust the saddle to find a safe and comfortable position for you (see page 19).

Ensure that you know which lever operates which brake (i.e. left or right, and front or back). Usually, the right brake lever operates the rear wheel brake and the left brake lever operates the front wheel brake.

Despite this general rule, however, you should still check which wheels the brakes are connected to since this standard isn’t always followed.

Modern braking systems might be more powerful or have a different functionality than those that you are used to. Practice operating the brakes in a safe area without traffic before you start a journey.

If you use a pedelec with carbon fibre wheels, please note that this material provides a significantly weaker braking effect in combination with rim brakes than aluminium rims do!

Also remember that the effectiveness of brakes can be different to what you are used to in wet conditions or on slippery surfaces. Adapt the way you cycle for slippery surfaces with possibly longer braking distances.

Please consult the operating manuals of the individual component manufacturers, which were supplied with your pedelec or may in some cases be found online.

Your specialist pedelec retailer will be happy to answer any further questions you have after reading this manual.

Ensure that the pedelec is ready for use and adjusted to fit your body.

This means:
- Checking the position and attachment of the saddle and handlebar
- Mounting and adjusting the brakes
- Making sure the brake handles are easily accessible (see page 21)
- Fastening the wheels securely onto the frame and the fork
- Checking the battery is firmly fastened
- Ensuring the battery is sufficiently charged for the planned trip
- Familiarising yourself with how the pedelec should be used
If rubber or plastic pedals have been put on your pedelec, familiarise yourself with their grip. When wet, rubber and plastic pedals are very slippery.

Snagging hazard
Moving and turning parts of your pedelec may lead to danger during use, maintenance and upkeep. Protect yourself by not wearing loose clothes that may get caught. During use, maintenance and upkeep, stay away from turning parts (wheels, brake discs, cassettes). Do not touch moving, sharp or protruding parts (cranks, pedals).

Make sure the wheels are securely fastened in the frame and fork. Check that the quick releases, slide-in shafts and all important nuts and bolts are secure (see page 17 and 39).
Lift your pedelec up slightly and drop it onto the ground from about 10 cm in the air. If it rattles or makes another unusual noise, ask a specialist retailer to identify and fix the problem before you use it.

Try to roll the pedelec forwards while pressing the brakes. The rear brake, when operated, must allow the rear wheel to lock, the front brake must lift the rear wheel off the ground. Please make an initial test ride in a safe place where you can familiarise yourself with the new brakes! Modern brakes can behave completely differently than those that you are perhaps used to. The pedelec’s steering should not rattle or have any play.
Check the air pressure in the tyres. You will find information as to the correct tyre pressure on the sides of the tyres or on the rims. Please adhere to the required minimum and maximum pressure! If the inflation pressure rating indicated on the tyre and on the rim differ, the lowest maximum pressure and the highest minimum pressure apply. A table with general pressure information can be found on page 29 of this manual.

As a general rule of thumb when you are out on a ride, you can check the tire pressure by doing the following: If you place your thumb on a pumped-up tire, you should not be able to significantly change its shape by applying pressure.
In addition, check whether there is an indication of maximum tire pressure stated on the rim. If so, this specified pressure must not be exceeded.
Check the tires and rims. Look for damage, cracks and deformations, foreign objects, eg glass splinters or sharp-edged stones, etc.
Never ride your pedelec if you notice cuts, tears or holes. First have your pedelec checked over by a specialist.

Before each ride
Before every ride, please check that:
• The lights and bell are working and safely secured
• The brakes are working and are safely secured
• The cables and fittings are not leaking if you have a model with hydraulic brakes
• The tires and rims are free of foreign objects and bear no damage and turn smoothly, particularly after riding off-road
• The tires have a sufficient tread depth
• The spring elements are working and safely secured
• The screws, nuts, quick release axles and quick releases are tight (see page 17) even if the pedelec has been left unattended for a short time
• There are no deformations or damage on the frame and fork.
• The handlebars, stem, seat post and seat are correctly and securely fastened and set up in the right position.
• The seat post and seat are secure. Try turning the seat or tipping it upwards or downwards. The seat should not move.
• If you are using clipless or magnet pedals, please check that they are working properly. The pedals should release easily and smoothly.
• The battery is secure
• Ensure the battery is sufficiently charged for the planned trip
Do not use your pedelec if you think it may not be in perfect condition. Have a specialist retailer check your bike. It is particularly important if you use your pedelec a lot, either for sports or daily use, that you regularly have all the important parts checked by a specialist retailer. Frame and fork, suspension components and other parts relevant to your safety such as brakes and wheels are subject to heavy wear, which can impact the operating safety of these parts. A component may unexpectedly begin to malfunction if you use it beyond its lifespan or recommended period of use. This may lead to accidents and serious injury.

Please make these checks before continuing after an accident or if your pedelec falls over. Aluminium parts cannot be safely bent back into shape, while carbon components can sustain damage which is not recognizable to the eye. Do not use your pedelec if you think it may not be in perfect condition. Have it checked and repaired by a specialist retailer. If damaged, aluminium parts are non-repairable. Carbon components can sustain damage which is not visible to the eye!

Riding a pedelec

- Practice operating and riding your pedelec in a quiet and safe place before you take to public roads!
- Please read all warnings and advice in this instruction manual carefully before using your pedelec.
- Keep in mind that you are travelling much faster on a pedelec than you would on a bicycle without an electric drive. Other road users may misjudge this.
- Always squeeze the brakes of your pedelec before placing a foot on the pedal. The electric engine starts working as soon as you begin to pedal. This boost is surprising to begin with, and can lead to falls or cause dangerous traffic accidents and injury to occur.

How your pedelec works

The drive is activated as soon as you begin to pedal. The amount of assistance depends on the settings you have chosen. The drive unit turns off as soon as you stop pedalling or reach maximum speed (25 km/h). The assistance is automatically reactivated as soon as the speed is below the maximum assistance speed and you reapply pressure to the pedal.

How to most efficiently use your pedelec engine:
- Always select the optimal gear and keep your pedalling rate between 60—100 rpm.
- Start with the low gears.
- As soon as your pedalling rate becomes too high, shift to the next higher gear.
- As soon as your pedalling rate becomes too low, shift to the next lower gear.
- If your pedelec uses a hub gear, reduce your pressure on the pedal before shifting gears.
- Staring at the display screen for too long while cycling may result in you falling off or causing an accident.
- When riding a pedelec, make sure that you are fully familiar with the starting characteristics of the pedelec before riding it. If the pedelec starts off suddenly, accidents may occur.
- Neither the bike nor the drive may be tampered with to increase the speed or performance of the pedelec. The application of tuning kits or modifying the gear transmission is not permitted.
Your pedelec’s range

It is best to charge your battery at warm temperatures and set it just before you start a journey.

The battery’s drain cycle may be effected by:

- Assistance level:
The higher the assistance level used, the higher the power consumption and the lower the range.

- Riding style:
With the optimal use of gear shifting, you can save energy. In lower gears, you generally need less power, less assistance, and your pedelec consumes less energy.

- Ambient temperature:
Batteries discharge faster at cold outside temperatures and have a shorter range.

- Terrain:
In hilly terrain, more energy is needed so the range goes down.

- Weather and vehicle weight:
In addition to the temperature, wind conditions can also have an effect on the range. A strong headwind requires more power when cycling. Bags and luggage will increase the weight, therefore more force is required.

- Technical condition of your pedelec:
Air pressure that is too low in the tires increases driving resistance, especially when riding over a smooth surface, such as tarmac. The range of your pedelec can be reduced by a rubbing brake or a poorly maintained chain.

Charging status of the battery:
The charge state indicates the amount of electrical energy that is stored in the battery at any given time. More energy means more range.

If you have a fall

Check the entire pedelec for any damage. This could be dents and cracks in the frame and fork but also bent parts. Also, if any parts such as the handlebars or seat have shifted or twisted, you need to check that these parts are working and safely secured.

- Examine the frame and fork closely. If you examine the surface from different angles, you usually will be able to clearly see any deformations.
- Check that the seat, seat post, stem and handlebars are still in the correct position. If this is not the case, DO NOT attempt to turn or bend the part back from its new position without undoing the corresponding screws. When fastening parts, always use the specified tightening torque. These values can be found on page 39 and in the chapter “Quick Release” on page 17.
- Check that both wheels fit correctly and securely in the frame and fork. Lift the pedelec up at both the front and rear to turn the front and rear wheels. The rim should move smoothly straight through the brakes. The tires must not touch the brakes. You can see from the distance between the frame or fork and the wheel whether the wheel turns without rubbing.
- Check that both brakes are operating fully.
- Do not set off again without having checked that the chain is fixed securely onto both the front chain wheel and rear sprockets. It must be engaged fully with the cogs. If you set off and the chain slips off a cog you may fall, at the risk of injury.

Aluminium components can break unexpectedly when deformed. Do not use any parts that have been deformed or bent, such as after a fall. Always replace these parts.

Carbon parts can be seriously damaged without it being noticeable. After a fall, have all carbon components checked by a specialist retailer.

If you notice any changes to your pedelec, DO NOT continue cycling. Do not retighten loose parts without prior inspection and not without a torque key. Take the pedelec to a specialist retailer. Tell them about the fall and have the pedelec examined!
Legal regulations

Within the scope of the European Union, there are different types of pedelecs and e-bikes for which different legal regulations apply.

A pedelec (pedal electric cycle) is a bicycle in which the rider is assisted by an electric drive when pedalling. Its engine can go up to 250 Watts (UK: 200 W), and its maximum speed limit is 25 km/h. It is therefore still considered to be a bicycle which does not need to be registered. The S-pedelec is the faster model. Once again assistance is only provided when pedalling, but it has a more powerful engine. It is generally 350 to 500 Watts and has a cut-off speed of 45 km/h. It is therefore regarded as a moped, light motorcycle or motorbike depending on location and is required by law to be registered and insured in Germany.

According to EU law, a pedelec is under the same category as a bicycle and, therefore, has the same requirements. The rules for using pedelec paths are also the same as for bicycles. Special rules may apply outside the EU and in some EU regions. Please stay informed about the national regulations applicable in your specific country.

To use bike paths with your pedelec, please consult the applicable legal practice in your country. The regulations governing the operation of a pedelec and the requirements regarding minimum age, certificates, official licenses and helmet requirements may vary in different countries. The same applies to the obligatory use of cycle paths. Please inform yourself about the applicable legal practice.

Separate regulations for S-Pedelecs / e-bikes

If pedal assistance is provided above 25 km/h, it is not considered a pedelec/e-bike according to Directive 2002/24/EC which has since expired. According to the current EU Regulation 2013/168/EU, type approval/approval for specific use is mandatory.

According to EU law:
- Speed pedelecs (S-Pedelec) are legally categorised as two-wheeled motor vehicles in class L1e, subcategory L1e-B (mopeds).
- On journeys using engine assistance only, you are not permitted to ride over 18 km/h.
- The engine assistance switches off when you reach approx. 45 km/h.
- A driving licence is required. The moped test certificate is mandatory.
- A driving license is required. Please inform yourself about the applicable regulations regarding licenses. It is possible that a minimum age is enough to be allowed to ride without a driving license.
- If you have a national driving license for a car, the required permission may be covered by this.
- You are required by law to wear a helmet and be insured. Before setting out on a ride, find out about the legal stipulations that apply to you.
- In general, parts can only be replaced by identical parts. Other parts may only be installed if they comply with your speed pedelec’s type approval. Specialist retailers may have lists of alternative parts which also comply with your speed pedelec’s type approval.
- **Child seats** may only be installed in speed pedelecs after the express approval of the manufacturer of the speed pedelec and if two seats are indicated in the type approval.
- **Passenger trailers** are not permitted for speed pedelecs, not even with approval from the speed pedelec or trailer manufacturer.
- **The blood-alcohol level limit is the same as when driving a car depending on the applicable legal stipulations.**

These regulations also apply to you if you are within the scope of the European Union. Other regulations may apply in other countries, including some European nations in isolated cases. Please inform yourself about the applicable legislation for using your speed pedelec.

---

**Intended use**

**Pedelecs are means of transport designed to be ridden by one person. Transporting an additional person on the bike is only permitted in the framework of national legislation. A tandem is exempt from this.**

If you would like to transport baggage, your pedelec needs to be fitted with suitable equipment. Children may be transported in child seats or in trailers intended for this purpose. Pay attention to quality. Ensure that you do not exceed the maximum permissible weight.

**Permissible total weight:** weight of the rider + weight of the pedelec + weight of the battery + weight of the baggage + weight of the trailer (if the trailer is permitted) (see page D).

**Dangers of improper use**

- Only use your pedelec for its intended use. Please read the section "Intended Use" in the original instruction manual. This also includes adherence to the operating, servicing and maintenance conditions that are described in this manual. Inform other users of the intended use and the dangers of not adhering to it. Improper use, overloading and lack of maintenance may lead to accidents and falls involving severe injuries to you and other people!

---

The electrical components are exclusively for use in electrically assisted bicycles, i.e. pedelecs or EPACs. They are not to be used for any other purpose. It is not permissible to use it for competitions or commercial purposes.

There may be a sticker on your pedelec that shows you what you can use your pedelec for.

Your pedelec must be equipped in accordance with the applicable national regulations in order for it to be used in the way indicated by this sticker.

Always read and comply with the conditions of use for your pedelec type:

**Road e-bikes / Pedelec type 1**

Can be used on normal and paved surfaces. The typical speed should be between 15 and 25 km/h. The tires should stay in contact with the ground at all times. They can occasionally be used to ride up and down small drops of 15 cm max. (e.g. curbs) as long as this is done carefully.
These pedelecs are intended for use for commuting and recreational rides with moderate exertion. Manufacturers and dealers are not liable for any use outside of the conditions of use for Type 1 pedelecs. This particularly applies to damage resulting from a failure to comply with the safety instructions, such as:

- off-road use;
- improper use;
- overloading;
- the improper repair of defects.

Type 1 pedelecs are not designed to withstand extreme use, i.e. riding down stairs or on jumps, performing tricks/stunts or racing in official competitions. Participation in competitions is only allowed when authorised by the manufacturer.

Gravel e-bikes / Pedelec type 2

The conditions of use for type 1 pedelecs apply. In addition, these pedelecs can be used on unpaved or gravel roads. They can also be used on routes with moderate elevations and gradients. The typical speed should be between 15 and 25 km/h.

The tires may repeatedly lose contact with the ground when riding on uneven terrain. They can be used for drops or jumps up to 15 cm high. These pedelecs are designed for recreational rides and trekking under moderate strain.

Manufacturers and dealers are not liable for any use outside of the conditions of use for type 2 pedelecs. This particularly applies to damage resulting from a failure to comply with the safety instructions, such as:

- off-road use;
- improper use;
- overloading;
- the improper repair of defects.

Type 2 pedelecs are not designed to withstand extreme use, i.e. riding down stairs or on jumps, performing tricks/stunts or racing in official competitions. Participation in competitions is only allowed when authorised by the manufacturer.

Competition e-bikes / Pedelec type 6

The conditions of use for type 1 pedelecs apply. In addition, their typical speed is between 30 and 55 km/h. In competitions or on other occasions, top speeds of over 50 km/h may be reached, e.g. during sprints or descents.

These pedelecs are designed for use in sporting and competitive events with high exertion. The conditions of use described require the rider to have sufficient expertise and technical skills.

Manufacturers and dealers are not liable for any use outside of the conditions of use for type 6 pedelecs. This particularly applies to damage resulting from a failure to comply with the safety instructions, such as:

- off-road use;
- improper use;
- overloading;
- the improper repair of defects.

Type 6 pedelecs are not designed for extreme strain, such as riding down stairs or on jumps or performing tricks or stunts.

If you are not sure what type of pedelec you have, ask your specialist retailer or the manufacturer about its intended uses. Before riding on public roads with your pedelec, inform yourself about the applicable regulations in your country. Only ride on pathways and trails that are permitted for vehicles. Special regulations may apply in part. Please inform yourself about the applicable national regulations in your specific country.
Pedelec tuning is prohibited

Unauthorised intervention is prohibited
Do not modify the pedelec’s technology in any way. Manipulating the bike in any way to increase performance or speed can lead to legal problems and/or make the bike less safe to ride. Sprockets may not be replaced by parts that are not original parts.

Possible legal implications:
• The pedelec is required by law to be registered for approval and insured. All legal requirements regarding the bike’s configuration and as stated by the road traffic licensing authority must be adhered to.
• The manufacturer does not offer any kind of guarantee, warranty or liability.
• Criminal consequences cannot be ruled out. For instance, an accident with a tuned pedelec may result in a legal offence.
• Termination of pedelec/bicycle insurance

Possible technological implications:
• Tampering with the bike’s technology may limit its capabilities, cause defects or break the bike parts.
• The motor and battery may become overloaded and overheat. Consequences: Irreparable damages and risk of fire.
• The brakes and other parts may become overworked. Consequences: Malfunction, overheating, increased wear and tear.

Electrical system
Modern pedelec technology is high tech, and working on pedelec parts requires expert knowledge, experience and specialist tools. Do not do any work on your pedelec yourself. Contact a specialist dealer.

The electrical system includes the following components:
• Display
• Control unit
• Battery
• Drive unit
• Charger
• Sensors

The A-weighted emission sound pressure levels at the rider's ears is below 70 dB(A).

Important safety instructions for electrical and electronic systems

The electrical system of your pedelec is very powerful. If you notice any damage to the electrical system, remove the battery immediately. After a fall or accident, live components may be exposed. If you have a question or problem, please contact a specialist dealer. A lack of expertise can lead to serious accidents.

Before performing any work on your pedelec, disconnect the electrical system and remove the battery.

Do not clean the pedelec with a steam jet, high-pressure cleaner or water hose. Water may seep into the electrics or drive and destroy the equipment.

The operating temperature should be between -15°C and +45°C. The recommended storage temperature is between -10°C and +35°C.

Only perform operations described in this manual. Do not change the bike. You should not disassemble or open any modules. If in doubt, always contact a specialist dealer.

Replace parts that are defective or worn, such as the battery, charger or cable, with original spare parts produced by the manufacturer or parts recommended by the manufacturer. Otherwise, any guarantees and/or manufacturer’s warranties will be voided. If non-original or incorrect spare parts are used, the pedelec may not function correctly. In case of a defect, please contact a specialist dealer.
Improper operation of the drive system and changes made to the battery, charger or motor may result in injury or costly damage. In this case, the manufacturer declines any liability for the damage caused. Changes to the electric system may result in criminal prosecution. This may be the case if the maximum assisted speed is modified.

Your pedelec is supplied with the corresponding operating manual for the integrated drive from the component manufacturer. For more information about the bike’s operation, maintenance, upkeep and technical data, read the instruction manual along with the websites for each of the manufacturer’s parts.

Don’t let children who are unattended ride the pedelec without first thoroughly instructing them on how to use it. Explain to children the dangers of using electrical devices. Do not allow children to play near the product.

The pedelec is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lacking the required experience and knowledge, unless supervised or having received instructions concerning use of the product by a person responsible for their safety.

This pedelec can be operated in the rain. However, do not deliberately immerse it in water.

When shipping the pedelec on a vehicle exposed to rain, remove the battery and store it in a safe place to stop it from getting wet.

Your pedelec has a “pushing aid” function, whereby it moves at up to 6 km/h without the need to pedal yourself.

The pushing aid function works to assist you if you, for example, have to climb a steep ramp from an underground car park or underpass. Do not use it to ride the bike.

Both wheels must be on the ground when using the pushing aid, otherwise there is a danger of serious injury.

Switching the electrical system on and off

To switch the electrical system on, use the on/off key on the external control unit (if there is one) or the on/off key on the battery. To turn it off, push and hold down the same key until the system turns off.

Requirements:
The following requirements must be met before you can activate and use your pedelec:
• A sufficiently charged battery must be used.
• The battery must be inserted correctly into the battery holder.
• The motor, control unit, battery, etc. must all be connected correctly.

Display and control unit

Your pedelec can be equipped with various displays and control units. Some manufacturers offer the possibility to link the display with your smartphone and configure the settings.
Please refer to the enclosed functional description and operating manual provided by the manufacturer.

Battery

Your pedelec can be equipped with different batteries. In some models the battery is integrated into the frame. More specific details and specifications can be found in the manufacturer's instruction manual delivered with your pedelec.

Read the indications printed on the external label of the battery before using the battery.

Rechargeable Li-Ion Battery

- Model No: XYZ
- Nominal Voltage: 48V DC
- Energy: 556.8 Wh
- Capacity: 11.6 Ah
- Cell designation: 13ICR19/66-4

Safety advices for Lithium-Ion batteries

- Don’t crush
- Don’t heat or incinerate
- Don’t short-circuit
- Don’t dismantle
- Don’t immerse in any liquid it may vent or rupture

Respect charging instructions

- Charge 0 to 50°C
- Discharge -10 to +60°C

Made in Germany

GEB 15-W5/Art.: 14091-3/F119205

Label (example)

Use only original chargers from the manufacturer to charge the battery.

- The battery is not fully charged when delivered. Recharge the battery completely before the first use and before storing.
- Under normal operating conditions, immediately charging the battery after each use will increase the battery’s lifespan. Never allow your battery to drain completely. Recharge your battery even after using it for a short time.
- Do not charge the battery for longer than recommended by the manufacturer.
- If the battery is completely discharged, charge it as soon as possible. Leaving the battery uncharged for long periods of time will damage its capacity.

When using or giving out a spare key for the battery, be sure to provide the number on the battery key. Please keep the number in your mind or your notebook.

Safety Instructions

Risk of fire or explosion if battery is used with an incompatible system. Do not open, disassemble or pierce battery due to risk of short circuit, fire or explosion. Should the battery fall or suffer a heavy impact, stop using it and consult a
specialist retailer. Only use the original charger as supplied with battery due to risk of fire or explosion. Disposal of used batteries should follow locally enforced regulations. Please carefully read the manual before use.

• Use the charger only in dry areas and do not cover it during operation. It could otherwise short circuit or cause a fire.
• When cleaning the charger, always unplug the charger from the power outlet first.
• Read the instructions on the charger before you start charging the battery.
• Do not drop or throw the battery. Avoid any strong impacts. This may result in fluid leakage, fire or explosion.
• Do not apply force to the battery. If the battery becomes deformed, the built-in safety mechanism may be damaged. This may result in fire or explosion.
• Do not use the battery when damaged. The battery fluid may leak, and it can cause loss of vision if it comes into contact with your eyes!
• Remove the battery from the pedelec if you want to transport it (e.g. by car).
• Also, remove the battery if you want to do any work on the pedelec (e.g. maintenance, assembly). You are at risk of injury or electric shock if you accidentally press the on/off switch.
• Never open the battery. Doing so may cause a short circuit. Any warranties or guarantees are void if the battery has been opened.

• Do not store or carry the battery with metal objects that can cause short circuits (e.g. paper clips, nails, screws, keys, coins). A short circuit may result in burns or fire.
• Keep the battery away from heat sources, such as strong sunlight and fire. Failure to do so may result in an explosion.
• Do not expose the battery to water or other liquids. Contact with them may damage the battery’s safety circuit and safety mechanism. This may result in fire or explosion.
• Do not clean the battery with a high-pressure washer. Use a damp rag when cleaning the battery. Never use aggressive cleaning solutions.
• If improperly used, the battery may leak fluid. This may result in skin irritation and burns. Contact with the battery fluid. If you do come into contact with it, rinse the fluid off with plenty of water. In case of contact with eyes, seek medical attention.
• Fumes may be released in the event of damage and/or improper use. Provide fresh air and seek medical attention in the event of any complaints.
• The battery must be fully snapped into place and locked in the holder before beginning a journey, you may otherwise lose the battery while riding.
• Avoid deep discharging the battery. Doing so will result in irreversible cell damage.
• The battery is only suitable for use with electric bicycle drives from pedelecs. Improper use or handling may result in injury or fire. The manufacturer is not liable for any damage resulting from improper use.

Battery storage

If you do not use your pedelec for an extended period of time, remove the battery, charge it (60-80%) and store it separately in a frost-free, dry room.

• Avoid direct sunlight. This can lead to overheating, distortion, rupturing, poorer performance and a shorter lifespan of the battery.
• To prevent deep discharge, the battery will go into sleep mode after a certain time.
• Do not expose the battery to temperatures outside the permissible storage temperature range of -10 °C to 35 °C. Note that temperatures of over 45 °C are common near heaters, in direct sunlight or in overheated vehicle interiors.
• When storing the battery for a longer period, make sure it is charged to at least half its capacity, and charge it again three months later. Do not wrap it with conductive material, as to do so will cause damage due to direct contact between metal and the battery.

If you notice the battery becoming hot during use, charging or storage, developing a strong odour, changing appearance, or any other abnormality, do not continue to use the battery. Contact a specialist dealer.
Battery wear

The battery can be charged approximately 500 times. The battery capacity decreases during this time, making the battery drain faster with the use of the pedelec’s motor assistance. This does not constitute a defect. Technically, this counts as battery use. If the range is still sufficient, you can continue to use it.

The battery life depends on various factors:
• The number of charging operations (about 500 charging cycles)
• The age of the battery
• Storing and Operating Conditions

Of course, your battery will deteriorate and capacity will be lost even if you do not use the battery.

The lifetime of your battery can be lengthened by the following measures:
• Charging your battery after every ride, even short trips. Lithium-ion batteries are not subject to a memory effect.
• Avoiding using high gears with high assistance levels.

Charging the battery

You can usually charge your battery both while it is mounted on the pedelec and removed. Please read the component manufacturer’s operating instructions in this regard.

Lithium-ion batteries are not subject to a memory effect. You can recharge your battery at any time, even after short trips.

Charge your battery at temperatures between 0 °C and 45 °C (ideally at room temperature or 20 °C). Do not charge the battery if it is still warm or hot after intensive use. Give the battery sufficient time before charging to reach this temperature.

Before charging, read the drive manufacturer’s instructions in the system manual and on the charger.

Typical charging process
1. First insert the plug of the charging cable into the charging socket on the battery, then the plug the charger into a socket.
2. As soon as the charger is connected to the power supply, a red LED will light up.

Charging time depends on various factors. It can vary greatly according to the temperature, age, usage and capacity of the battery. Information about your battery’s charging time can be found in the technical information regarding your battery. When the battery is fully charged, the charging process is automatically terminated. Unplug the plug from the battery and the power outlet.

Safety Instructions

Only use the charger designed for your battery.

Make sure you use the correct mains voltage. The required mains voltage is indicated on the charger. It must comply with the voltage of the current source. Chargers marked 230V can also be operated at 220V.
• Do not touch the power plug with wet hands. There is a risk of electric shock.
• Note: Sudden temperature changes can cause condensation to form on the battery. Avoid this by storing the battery in the same place it is charged.
• Before use, check that the charger, cable and plug are not damaged. If damage occurs, do not use the charger. There is a risk of electric shock.
• Charge the battery in well-ventilated rooms only.
• Do not cover the charger and/or battery during charging. There is a risk of over-heating, fire, or explosion.
• Only charge on a dry, non-flammable surface.

The battery has to be recharged completely at least every 3 months, in order to avoid damaging or destroying the cells.

If the charging cycle is taking longer than usual, the battery may be damaged. In this case, immediately stop charging. Contact a specialist dealer.

The charger is specially designed for charging lithium-ion batteries. It is equipped with an integrated fuse and protection against overcharging.

Operating Instructions

Read the indications on your charger’s external label before using the battery.

Charger

The charger must not be taken apart. Leave maintenance work to qualified professionals and consult a specialist retailer. Make sure to read the information about your battery charger before charging your battery for the first time. Unplug the charger before attaching or removing the battery from the charger. Flammable gases can leak out. Prevent flames and sparks.

Keep the charger away from children and animals. Small children and animals may damage the cable while playing. This can lead to an electric shock, a malfunction or a fire.
• The charger must not be used by children, or by persons with limited physical, sensory or mental capabilities, unless under the supervision of a responsible adult.
• Make sure the charger is clean to avoid risk of electric shock.
• Do not use your charger in humid or dusty places.
• Avoid direct sunlight.
• Only use the charger that came with your pedelec or one produced by the same manufacturer.
• Don’t cover the charger while it is in use. It could otherwise short circuit or cause a fire.
• When you clean the charger, unplug it from the electrical socket first.
• If the charging process takes longer than recommended by the manufacturer, stop it before the end.
• After charging, if not in use, remove the battery from the charger and unplug the charger.

Drive unit

Your pedelec can be powered by a mid-engine or a rear engine.

Keep in mind that the motor of your pedelec can heat up during long uphill runs. Do not touch the motor, as you may get burnt.

During operation, a quiet engine sound can be perceived. This noise may grow louder with increased strain and is completely normal.

Note that if the road surface or ground are slippery (due to rain, snow, sand, etc.), there is a risk that the drive wheel of your pedelec may skid and slide.

Maintenance and care

Before performing any kind of work on your pedelec, turn off the electric unit and remove the battery. Not doing so may result in serious injury and/or electric shock.

Only perform operations described in this manual. Do not change the device. You should not disassemble or open any modules. If in doubt, always contact a specialist dealer.

Keep the all components of the electrical system clean. Clean gently with a damp, soft cloth. The components must not be immersed in water or cleaned with a water jet or steam jet. If the components are no longer functional, contact your dealer.

The frequency of maintenance will vary depending on riding conditions. Periodically clean the chain using an appropriate chain cleaner. Do not use alkaline or acidic cleaning agents to remove rust under any circumstances. If such cleaning agents are used, they may damage the chain and serious injury may result.

Only have maintenance, repairs and repair work carried out by qualified personnel and only with original spare parts. In case of a flat tire or other technical problem, contact a qualified professional to carry out the repairs.
• Open live parts should only be maintained and cleaned at a specialist pedelec shop.
• Only replace parts of your pedelec with original parts or parts approved by the manufacturer. Otherwise, warranties or guarantees may be voided.
- Remove the battery before cleaning your pedelec.
- Ensure that you do not touch or accidentally connect contacts when cleaning or maintaining the battery. You are at risk of injuring yourself or damaging the battery if these are live.
- Cleaning with a high-pressure device may result in damage to the electrical system. The high pressure can cause cleaning fluid to seep into sealed parts and damage them.
- Avoid damaging cables and electrical parts. When this occurs, the pedelec must be decommissioned until a specialist retailer has examined it!

**Wear and tear and warranty**

The pedelec and all mechanical parts are subject to wear, tear and heavy use. Different materials and parts may react differently to wear or permanent strain. If a component is used for longer than it is designed for, it may suddenly stop working and possibly lead to injury or cause additional damage. Any kind of tear, puncture or colour change seen in an highly used area indicates that the component’s use has reached its limit; the component should in this case be replaced.

Keep in mind that pedelec parts are subject to greater wear than those of a bicycle without an additional drive. This is due to the greater weight of the vehicle and the higher average speed that is achieved through the propulsion. This higher level of wear is not a material defect and is not subject to warranty.

Typical parts affected by this are:
- Tires
- Brake pads
- Components of the drive
- Spokes

The battery is subject to ageing and is therefore also a wearable part. Please note that the battery gradually loses its capacity depending on its age and operating life. Take this into account when planning journeys and ensure that you switch to a new battery in good time. Replacement batteries are available from your specialist pedelec retailer.

**Adjusting the pedelec to the rider**

The seat post, seat, stem and handlebars can be tightened and secured with quick releases or bolted connections.

For detailed information, please read the operating instructions supplied by the manufacturer. Only specialists should work on your handlebars and stem.

Possible positions for adjusting bolted connections

Possible positions of quick releases and through axles

* see page 39
Using quick release levers and through axles

Quick release levers and through axles are systems installed on the pedelec in place of bolted connections. They consist of two parts: the quick release lever, which provides the necessary clamping force, and the adjustment nut, which allows you to regulate the tightness. You can change the tightness of your quick release when it is open.

Quick releases should be closed with the correct tightness. To close the lever correctly, pressure should be felt when it is half closed and, at the end, the ball of the thumb needs to be used to completely close it.

- All quick releases must be firmly closed before you set off.
- Make sure all quick release levers and through axles are securely and properly fastened – even if the pedelec has only been left unattended for a short time.
- A closed quick release fastener must be folded in close to the frame, fork or seat post.
- When closed, the tip of the quick release lever must always be pointed backwards. This way, it won’t open during the ride.

When you park your pedelec, attach wheels or other parts of your vehicle that are attached with quick release fasteners in with your bike lock.

Through axles

- The quick release lever for the wheel has to be installed on the opposite side to the brake disc to avoid burns from contact with the hot brake disc. The clamping force of the quick release can also be reduced if it is heated by the brake disk.

- If your pedelec has one or several quick release axles, please read the corresponding instructions provided by the component manufacturer on how to operate and service these parts.

In current chassis, quick release axles may be used in place of quick releases or bolts. These usually function like quick release levers and should be operated as such.

Slide-in shaft in the fork ends, without hub, Rock Shox fork®
The skewer is screwed into the dropout and fixes the hub inside the fork or into the dropouts in the frame. The hub and the skewer may be fastened with a quick release lever, which is operated just like a normal quick release. Systems in which the shaft is only inserted or screwed in and then fastened with a screw also exist.

**Installation**
Place the wheel in the dropouts. The hub must be firmly pushed into the dropout. Close the attachment mechanism. For vehicles with disc brakes, ensure that the brake disk is properly inserted into the calliper. Ensure that neither the brake disk nor the hub or the brake disk fastening screws rub against the lower parts of the fork.

**Installing the pedals**
If your pedelec was supplied without the pedals pre-installed, these have to be attached with the correct spanner or wrench. Please note that the pedals have to be screwed in in different directions and secured with a high mounting torque (see page 39). Coat both threads with assembly lubricant.

**Inappropriately installed wheels**
Inappropriately installed wheels may shift while you are riding or become detached. This may damage the pedelec or even expose the rider to severe and life-threatening injuries. It is therefore important to take note of the following instructions:
- Ensure that the dropouts and quick release mechanisms are clean and free of dirt and impurities.
- Ask your specialist dealer to explain in detail how to correctly fasten your wheel with the quick release axle system.
- Firmly fasten the front wheel.
- Never ride your pedelec when you are not sure if the front wheel has been appropriately fastened and cannot come loose.

* See page 39
Practice clipping your shoes in and out of the pedals’ locking system before your first ride in a quiet, safe place. Any trouble releasing from clipless pedals is a safety risk.

With system pedals, you can adjust how much force you need to release the shoe from the pedal. Please test this on your first ride with a setting that releases very easily! Regularly clean your magnet pedals and keep them in good condition with a suitable spray lubricant.

If your pedelec has rubber or plastic cage pedals, please familiarise yourself with the grip which these offer. In wet conditions, rubber and plastic pedals can be very slippery!

Adjusting the saddle

Before you use your pedelec for the first time, the saddle position has to be adjusted to suit your body size. This will allow you to ride your bike safely.

The height, horizontal orientation and inclination must be adjusted for the saddle and the height and orientation of the stem for the handlebars.

Finding the correct seat height

Adjust the saddle to the estimated correct height. Sit on the pedelec. Have someone help hold you in place or lean against a wall or railing. Move a pedal to its lowest position and place your heel on it. Your leg should now be straight. If you now place your foot in the correct riding position, your leg should be slightly bent.

Never pull the seat post further out than the maximum mark on the tube frame! If there is no maximum mark, the seat post should always be at least 7.5 cm deep in the tube frame.

You are using the correct foot position for riding when your foot’s widest point is above the pedal axle.

If you are using clipless pedals, you should adjust the pedal plates to ensure that your foot is in this position. The widest part of your foot should be above the pedal axle.

This prevents damage to the musculoskeletal system and ensures maximum transmission of force.
The minimum saddle height should be adjusted according to the rider's individual body size. He should be able to cycle without it interfering with his health or safety. The seat post's maximum extension should allow it to remain securely clamped into place by the bolt. Ask your specialist retailer for advice on these last two points.

**Adjusting the saddle tilt**

If you have adjusted the saddle height, the saddle inclination should be checked and adjusted as well. The surface of the saddle should always be approximately parallel to the ground. You can perform this adjustment when the seat clamp bolts of the seat post have been undone.

For information concerning the installation and service of threaded and telescopic seat posts, read the manufacturer's service manual.

If your pedelec is equipped with an integrated seatpost i.e. a seatpost with an integrated fixture, please read the enclosed instructions regarding operation and adjustment from the component manufacturer.

Before you start riding, please test to see if your seat post and seat are secure. To do this, grasp the saddle at the front and back and attempt to turn it. It should not move.

* see page 39
Handlebar position/adjusting the stem

For detailed information, please read the operating instructions supplied by the manufacturer.

Only specialists should work on your handlebars and stem.

Various types of stem are used on pedelecs:

Threadless stem

Height adjustment possible

Changing the position of the stem also changes the position of the handlebars. You should always be able to safely reach and use grips and controls. Please ensure that all cables and lines are long enough to allow you to turn the handlebars in every possible way.

A-head stems

Height change possible as follows:
- Exchange of fitted spacers under or above the stem
- Turning of the stem
- Exchange of the stem

Quill stem

Adjustment of stem tilt possible

Quill stem

Setting up the brake levers

The brake levers should be set up so that your hands can safely and comfortably apply them.

Please familiarise yourself with which lever operates which brake!

Check the position of the brake levers before your first ride. In derailleur gear systems, the left brake lever on the handlebars generally operates the front wheel brake. If you would like to swap the position of the brake levers on the handlebars, please contact a specialist retailer to do the work.

In order to be able to apply the brake lever if you have smaller hands, in some models it is possible to position the brake levers closer to the handlebars using special equipment. For more on this, please read the enclosed instructions from the component manufacturer. Set up the brake levers so they do not touch the handlebar grip even when they are applied to their fullest extent!
For more on this, please read the enclosed instructions from the component manufacturer.

Mechanical brakes can usually be readjusted by turning the adjustment screw. Loosen the adjustment screw until it is possible to brake safely. Secure this position by tightening the locknut.

Children

Children and pedelecs

Inform yourself on whether the child is old enough to ride the bike and has the necessary license to do so before allowing him or her to ride the pedelec. Pedelecs may only be ridden by children that are of legal age and possess the necessary permit. In the EU, a generally accepted recommendation is a minimum age of 14 years for the use of a pedelec.

Don’t let children who are unattended ride the pedelec without first thoroughly instructing them on how to use it. Explain to children the dangers of using electrical devices.

Carrying children / trailers for children

- Please only use safe, certified children's seats.
- The child must wear a helmet, their feet must be tucked in and protected from any possible contact with moving parts, such as spokes.
- A child seat changes the way your pedelec behaves when riding. Take note of the longer braking distances and the steering which could be less stable. Practice riding with a child seat in a safe area before taking to public roads.

Only install children's seats on pedelecs which are intended for this kind of equipment. Carbon fibre frames and components are not suitable for the use of children's seats. Never attach a children's seat to the seat post. Wrap and protect all springs and moving parts on the saddle and seat post. Please ensure that your child cannot trap their fingers anywhere. This could result in injury!
In Germany, children may only be transported in child seats up to the age of 7 years. Find out about the legal regulations which relate to the age of the child and the rider.

If additional equipment was delivered with your pedelec which was not pre-assembled, please ensure that you read the manufacturer’s instructions.

Child bike trailers:

- Please comply with the manufacturer’s instructions supplied with the trailer.
- Take no chances in terms of quality when buying bike trailers for children.
- It is easy not to see a child bike trailer in traffic! Use a brightly coloured flag and approved light system to ensure that it is easily seen. Ask your specialist retailer about safety equipment.
- Notice that trailers make the pedelec much longer than usual. Riding a pedelec around corners with a trailer is different to riding without. You must keep this in mind when riding in traffic. Before riding on public roads, practise riding your bike with an empty trailer in a safe and quiet environment.

Only install child bike trailers and child seats on pedelecs which are intended to have these installed or on pedelecs approved for such use.

Passenger trailers are not permitted for speed pedelecs. Special regulations apply to child seats, see page 7.

Check whether the manufacturer provides a maximum permitted weight and a maximum permitted speed. If so, these values must be adhered to. Children under 16 are not legally permitted to ride a bike with a trailer in Germany.

Frame shapes vary according to the type and function of the pedelec. Thanks to the evolution in materials and construction techniques, it is nowadays possible to produce all shapes of frames safely so they perform stably during riding. So despite a low step-through, you can still be sure that your pedelec is always safe on the roads, even with luggage on board.

- Top tube
- Seat stay
- Seat tube
- Down tube
- Chain stay
- Head tube

Carbon frame
If your e-bike is stolen, it can be identified using its frame number. Please always note down the full number in the correct order. If you do not have the number it will be impossible to make a unique identification. In the documentation you received from the retailer when you purchased your pedelec, there is also a section where the frame number is entered. The frame number can also be engraved on various parts of the frame. It is often located on the seat tube, on the drop-outs or on the bottom bracket shell.

Under no circumstances should you ride with a bent or broken frame. Never attempt to repair damaged parts yourself. Otherwise, there is a danger of accidents. Faulty parts should be replaced by a specialist retailer. Please only ride your pedelec again when the parts affected have been replaced. Faults on the frame or other parts can cause accidents. If your pedelec does not ride in a straight line without any problems, this can be due to a bent frame or fork. Please contact a specialist retailer to have the frame and fork checked and possibly to have the bike realigned.

Suspension

If your pedelec is equipped with suspension elements, they must be adjusted to suit the rider’s weight and intended purpose. Expertise and experience are needed to perform this kind of work. Therefore, if you need to adjust the suspension, it is best to bring your bike to a shop.

Carefully read the enclosed manual concerning the suspension system to your pedelec.

A typical suspension fork can look like this:

Any adjustment to a suspension fork must be carried out in accordance with the suspension fork manufacturer’s operating manual. As a general rule, the suspension fork should show noticeable movement when riding over uneven surfaces but should not “knock” (i.e. compress all the way to the limit stop).
A suitable basic set up would see the suspension pushed in around 10–15% (cross country), 15–20% (touring) or 25–33% (enduro, freeride, downhill) of the spring travel when the rider is sitting normally on the pedelec.

Suspension forks can only function effectively if they are regularly cleaned. Purpose-made cleaning products or warm water with washing up liquid are suitable here. Specialist retailers also stock suitable spray lubricant for greasing your suspension regularly, both after every clean and otherwise. The same applies for suspension seat posts.

Most suspension seat posts can be adjusted to the rider's weight. However, in most cases this requires the seat post to first be extracted from the frame. Contact a retailer if you have any questions about this.

In this case, the frame’s rear fork is flexible and a shock absorber provides suspension and damping. Some shock absorbers use a metal spring to absorb vibration, while others do this with an air chamber.

The absorbability, which regulates the speed of compression and stretching, can be adjusted in high quality shock absorbers.

**Maintenance and upkeep**

- **Suspension forks**
  - Suspension forks can only function effectively if they are regularly cleaned.
  - Purpose-made cleaning products or warm water with washing up liquid are suitable here.
  - Specialist retailers also stock suitable spray lubricant for greasing your suspension regularly, both after every clean and otherwise.
  - The same applies for suspension seat posts.

- **Most suspension seat posts**
  - Most suspension seat posts can be adjusted to the rider's weight.
  - However, in most cases this requires the seat post to be extracted from the frame.

- **Shock absorbers**
  - Some shock absorbers use a metal spring to absorb vibration, while others do this with an air chamber.
  - The absorbability, which regulates the speed of compression and stretching, can be adjusted in high quality shock absorbers.

- **Maintenance and upkeep**
  - **Only have components replaced by original spare parts from the manufacturer or by parts approved by the manufacturer.**
  - **Please have your pedelec checked by a specialist retailer on a regular basis. They recognise damage and worn components and can advise you on the choice of a replacement. Refrain from repairing key parts yourself (frame, fork, handlebars, stem, headset, brakes, lights).**
  - **Modern pedelec technology is high tech! Working on pedelec parts therefore requires expert knowledge, experience and specialist tools. Do not do any work on your pedelec yourself. Take your pedelec to a specialist workshop if it is in need of repair, maintenance or restoration.**

- **Screws and torque wrenches**
  - When working on the pedelec, please ensure that all screws are tightened to the correct torque.
  - On many components, the torque required for mounting is printed.
  - Measurements are given in Newton metres (Nm) and applied with a torque wrench.
  - It is best to use a torque wrench that displays the tightening torque as it is in use.
  - Otherwise, screws can snap or break.
  - If you don’t own a torque wrench then you should always leave this work up to a specialist retailer!
  - A table listing the most important torques for bolted connections is provided on page 39.

- **The pedelec and all mechanical parts are subject to wear, tear and heavy use. Different materials and components can react to wear and tear in different ways. If a component is used for longer than it is designed for, it may suddenly stop working and possibly lead to injury or cause additional damage. Any kind of tear, puncture or colour change seen in an overused area indicates that the component's use has reached its limit; the component should in this case be replaced.**

- **Torque wrench**
Wear suitable protective clothing, protective gloves and protective goggles during all installation and maintenance work. Otherwise, dirt or injuries that may be caused by lubricants and auxiliary devices for the motor among other things may result.

Chain

Cleaning the chain
To ensure it works effectively, the pedelec chain has to be cleaned and greased regularly (see page 38). Dirt can be removed when washing the rest of the pedelec. Otherwise you can clean the chain by rubbing it with an oily cloth. If it is clean, it should be lubricated at the joints with the appropriate lubricant. After a while, the excess lubricant should be wiped off.

Chain tension

To ensure that the chain and gears work safely, the chain has to have a certain level of tension. Derailleur gear systems tense the chain automatically. For gears that are mounted without a chain tensioner, the chain must be tightened if it is found sagging. It might otherwise jump off the gears and lead to a fall.

In the case of pedelecs with adjustable dropouts, the mounting screws of the axle housing should be loosened and tightened, and not the axle nuts. If the bottom bracket shell contains an eccentric bush, please tighten the chain according to the instructions provided by the corresponding manufacturer.

Make sure that the axle nuts are correctly fastened!

Dirt and permanent strain wear the chain. The chain should be replaced as soon as it can be significantly lifted (approx. 5 mm) from the front chain ring. Modern chains for derailleur gear systems no longer have chain connectors. Specialised tools are needed to open/change/close them. This work should be carried out by a professional or a specialist retailer. Other chains are supplied/assembled with chain connectors. In some cases, these can be opened without the need for tools. These chain connectors can also be used to repair a damaged chain on a ride if they have the correct width for the drivetrain.

* see page 39
**Determining chain wear**
You can determine chain wear with a specialised tool.

Measuring chain wear. If it is a new chain, the measuring tool will not sink in between the chain links.

If a chain is as worn as this one, the measuring tool will sink in completely. This chain must be replaced.

If a worn chain is not replaced, the cassette and chain wheel will become excessively worn. This may result in earlier breakdowns and higher costs.

**Belt drive**

If your pedelec is equipped with a belt drive, please read the attached component manufacturer's operating instructions before first use.

**Cleaning the belt**

In order to extend its lifespan, we recommend cleaning the belt with water or a hand brush (e.g. after riding through mud or dirt). Residue on the belt or belt pulleys can result in increased wear and noise (e.g. squeaking or creaking).

Check your belt drive for damage, material deformation and cracks each time you clean it, and, if in doubt, consult a specialist retailer for help with troubleshooting.

If you still notice any noise despite a thorough cleaning, a thin layer of dry silicone spray can be applied to the inside of the belt. This protects it against further build-up, reduces friction on the belt and reduces noise.

**Handling**

Please refer to the following handling instructions to extend the belt's lifespan. Improper handling may result in damage to the belt and necessitate a replacement!

- Do not bend or twist it
- Do not turn it inside out
- Do not bunch or coil it
- Do not use it as a belt whip
- Do not use tools or sharp instruments when handling the belt
- Do not use levers to place the belt on the belt pulley.
- Do not use tension or guide pulleys
- Do not oil

Ensure that the belt line, pulley angles and belt tension are in compliance with the specifications outlined in the manufacturer's operating instructions.

**Wheels**

**Checking the wheels**
The pedelec is connected to the ground by its wheels. The wheels are subject to a great deal of strain through the uneven characteristics of the ground and the weight of the rider.

Thorough checks and centring work on the wheels is undertaken before they are shipped from the manufacturer. However, during the first few kilometres of riding, the spokes bed in.
• After the first 100 kilometres, the wheels need to be checked by a specialist and centred again if required.
• The tension of the spokes should be checked at regular intervals. Loose or damaged spokes must be replaced or centred by a specialist retailer.

The wheels can be fixed into the frame and fork in different ways. Commonly, the wheel is attached with an axle nut or a quick release. In addition, there are also various slide-in connections which are screwed on or fixed with various quick release systems.

Checking the hubs
You can check the hub bearings as follows:
• Lift both wheels up from the ground by first lifting the pedelec at the front then at the rear. Spin each wheel to start them turning.
• The wheel should continue to turn and then slow evenly. If the wheel suddenly stops, the bearing is defective. One exception is front wheels with a hub dynamo. These have a slightly higher resistance. This is not noticeable when cycling, but can be seen in this test.
• The hub bearing should not exhibit play. Pull the wheels from side to side in the fork and frame to check if they are loose. No play should be noticeable here.
• If the wheels can be slightly moved in their bearings or are difficult to turn, the hub bearings have to be set up by a specialist retailer.

Wheels/Tires
Clean the braking surfaces regularly according to the inspection plan, page 36. Check the wear markers during this process.

Rims made of composite materials such as carbon fibre in particular require special attention. Friction caused by rim brakes, as well as just simply riding the bike, puts a high amount of strain on the bike.
• Only use brake pads that are designed for use on the rims’ materials!
• Before every ride, check rims and wheels made of composite materials for wear, deformation, cracks and chipping!
• If you notice any changes, do not ride with this part until it has been inspected by your specialist retailer or manufacturer and found to be in good condition!
• Never expose carbon fibre parts to high temperatures. Even intense sunlight (e.g. when the wheel is stored in a vehicle) can produce high temperatures. This may result in damage to the structure of the part. Failure of parts, falls and very serious injuries could result.

The permitted tire pressure may not be exceeded when inflating the tires. Otherwise this could lead to a tire bursting. The tires must be inflated to at least the stated minimum tire pressure. If the tire pressure is too low, there is a possibility that the tire could free itself from the rim. On the side surface of the tire, there is information on the maximum permitted tire pressure.

Rims undergo high strain and are safety-relevant parts. They will become worn from riding. If you see any damage, do not ride using this rim. Have them checked by a specialist retailer and replaced if required. Wear can weaken rims and lead to falls and serious accidents.

All screws must be tightened with the correct torque. Screws may break and parts may become loose if they are not tightened with the correct torque (see page 39 “Torques for screw connections”).

If a slide-in shaft is fitted on your pedelec, you can find more information in the enclosed operating manual or on the manufacturer’s website on the Internet.
pressure and generally also on the minimum permitted tire pressure. If you replace the tires, only exchange them for the same model with the same dimensions and profile. The riding experience can otherwise be negatively affected. If the inflation pressure rating indicated on the tire and on the rim differ, the lowest maximum pressure and the highest minimum pressure apply.

Tires are available in various dimensions. The tire dimensions are provided with standardised information. Example 1: “46-622” means that the tires have a width of 46 mm and the rim has a diameter of 622 mm. Example 2: “28 x 1.60” states that the tire has a diameter of 28 inches and a width of 1.60 inches.

Tires and tire pressure

The amounts for the recommended tire pressure can either be named in bar or PSI. The following table presents the conversions for the usual pressure levels and shows which tire widths these pressures should be applied to.

<table>
<thead>
<tr>
<th>Rider weight in kg</th>
<th>Tire width 23mm</th>
<th>Tire width 25mm</th>

</tbody>
</table>

You must observe the information provided by tire and rim manufacturers. This could possibly be different from the tire pressures listed here. Not adhering to these guidelines can lead to damage to your tires and inner tubes.

You should also regularly check your tires. The lowest and highest authorised pressures can be found on the side of the tire. Please adhere to these values, otherwise the tire may detach from the rim or burst. If the inflation pressure rating indicated on the tire and on the rim differ, the lowest maximum pressure and the highest minimum pressure apply.

Tires are wearable parts. You should therefore regularly check the pressure, tread and condition of your tires. Not every tire is suitable for every purpose. Allow a specialist retailer to advise you when selecting tires.

When replacing original tires or cranks, ensure that there is sufficient space between the tire and your shoe. Failure to do so may result in accidents and serious falls.

Your pedelec can only function safely and effectively if you replace parts with suitable, authorised replacements. Please consult your manufacturer, importer or specialist retailer for advice on suitable replacement parts.
Only replace broken or worn key parts with original replacement parts from the manufacturer or parts approved by your manufacturer. This is mandatory in the case of light systems, while the manufacturer’s warranty is usually nullified if you install non-approved replacement parts. Ask your specialist pedelec retailer for advice on suitable material.

If you install non-original or wrong replacement parts, this can lead to severe loss of function! Tires with poor grip or safety, brake pads with a low friction coefficient and incorrectly installed or poorly made lightweight components can all lead to potentially serious accidents. The same applies for improper assembly!

**Tubeless tires**
If your pedelec is equipped with tubeless tyres, read the enclosed instructions from the manufacturer of the tyres and rims.

- Only use tubeless tires in the prescribed way, with the correct air pressure and the recommended sealant if required.

**Tubular tires**
If your pedelec is fitted with tubular tyres, read the enclosed instructions from the manufacturer of the tyres and rims.

- Only use tubeless tires on rims intended for this purpose! This will be marked on the rims, with the abbreviation “UST” for instance.

- Only use tubular tires on rims intended for this purpose! These do not have rim flanges but smoothly curving surface, from the outside inwards. This is where the tubular tires are fitted.

**Flat tire repair for conventional tires**
Contact a pedelec dealer or an authorised workshop to fix flat tires. You will need specialised knowledge and specialist tools, especially when removing the drive wheel and disconnecting the motor connections. If you still want to perform the repair yourself, please obtain prior instruction (e.g. from a specialist retailer).

**Wheel removal and installation for wheels without a hub motor**
Always turn off the electrical system first and remove the battery before performing any kind of work! Failure to do so may result in electrical shock or serious injury.
To repair a punctured bike tire, you will need:
- Tire levers (plastic)
- Spanner or wrench (for wheels without quick release levers)
- Air pump
- Spare tube

**Disk brakes:**
- The wheel can be removed without any further preparation.
- Please note: when fitting the wheel, the disk must be slotted between the brake linings of the brake calliper and ultimately be centred without contact

1. **Removing the wheel**
   - If your pedelec has quick release levers or axles, open them (see page 17)
   - If your pedelec has hex nuts, loosen these with a suitable spanner anti-clockwise.
   You can then remove the front wheel according to the steps listed above.

2. **Disassemble tire and inner tube**
   - Remove the valve cap, the locking nut and possibly the union nut from the valve. For Dunlop valves, remove the valve core.
   - Let the remainder of the air out of the tube.
   - Insert the tire lever opposite the valve on the inside of the tire.
   - Insert the second tire lever approx. 10 cm from the first, between the rim and tire.

3. **Fit the tire and new inner tube**
   - Push the valve through the valve hole in the rim and place the hose inside the tire.
   - Use the ball of the hand to press the other side of the tire completely over the edge of the rim.
   - Verify that the tube is properly seated.
   - In the case of Dunlop valves: Replace the valve core in its seat and tighten the union nut.
   - Pump a little air into the tube.
   - Check that the tire is properly in place and turns straight using the control ring on the side of the tire. Correct the tire’s position by hand if it does not turn straight.
   - Pump air into the tire up to the recommended pressure.

Types of pedelec inner tube valves:
- Dunlop (Woods) valve
- Schrader valve
- Sclaverand

**Avoid foreign objects getting inside the tire.** Make sure that the tube is wrinkle-free and does not get pinched anywhere. Ensure that the rim tape covers all spoke nipples and does not show any sign of damage.
When mounting the wheel, pay attention to the rotational direction of the tire.

4. Mounting the wheel

Reattach the wheel securely back in the frame or fork with the corresponding quick release, bolted connection or full floating axle mechanism.

Make extra sure that the brake discs fit correctly between the brake pads!

To correctly and safely assemble and set up the gears, read the gear manufacturer’s instructions.

Tighten all screws to the recommended torque. Otherwise the screws could break and parts could fall off (see page 39).

- Check whether the brake linings touch the brake surfaces.
- Carry out a brake test.

Brakes

- Disc brakes with hydraulic or mechanical operation

Various versions of disk brakes are available for racing and cyclo-cross bikes. Always read the enclosed instructions from the parts manufacturer before the first ride. Make sure you practice and get used to operating the brakes on safe terrain before going on your first bike ride!

Almost all modern brakes provide considerably more braking power than was available for pedelecs in the past. Carefully familiarise yourself with the brakes, practise using them and emergency braking, starting on safe ground with no traffic before setting off onto roads with traffic.

If you are riding on a long or very steep slope, do not brake continuously or only use one brake. This could lead to the brakes overheating and loss of braking force.

You are braking properly and safely if you use both brakes equally. The only exception is if you are cycling in slippery conditions such as on sand or a smooth surface. You should then exercise great care, slowing yourself down using the rear brake. Otherwise there is the risk of the front wheel slipping out to the side and causing a fall.

On very long downhill stretches, you should avoid lightly braking constantly. It is preferable to brake sharply for a shorter time when taking bends or if you are riding too fast. This allows the brakes to cool down in the meantime. This preserves your braking power.

Your pedelec is supplied with the corresponding operating manual for your specific gear system. You can get more information about the gears on your pedelec in the operating manual provided by your manufacturer or on the manufacturer’s website.
Brakes and brake systems are parts that can be vital to your safety. You should therefore service them on a regular basis. This requires specialist knowledge and special tools. Allow your specialist retailer to do this type of work on your pedelec! Work that is improperly carried out is a risk to your safety on the pedelec!

No oil-based liquids should ever be applied to brake pads, rim brake surfaces, brake shoes or brake discs. These substances reduce the effectiveness of the brakes.

Break pad wear

Normal operation wears down brake discs and brake pads. It is therefore important to regularly check the condition of your braking system and brake pads. Replace worn brake pads in good time! Ensure that rims and brake discs are clean and free of any oil.

After any work on the braking system, perform at least one brake test on safe, empty terrain before you return to traffic.

Have the brake fluid replaced on a regular basis. Check the brake shoes regularly and have them replaced when they are worn out. Further information can be found in the operating manual provided by the brake manufacturer.

Disc brakes with hydraulic or mechanical operation

Disk brakes:
- The wheel can be removed without any further preparation.
- Please note: when fitting the wheel, the disk must be slotted between the brake linings of the brake calliper and ultimately be centred without contact.

Bedding in disc brakes

New disc brake pads and brake discs have to be bedded in carefully before you ride the bike for the first time. This process optimises brake performance.

The bedding-in process involves sharp braking. You should be familiar with braking power and the use of disc brakes. Sharp braking without being familiar with brake performance and the operation of disc brakes, can lead to accidents causing severe or fatal injury. If you are unsure, you should have a qualified bicycle/pedelec mechanic perform the bedding-in process for you.

Proceed as follows:
To bed in the brakes, accelerate the pedelec to 30 km/h and then bring the pedelec to a halt by applying maximum braking. Repeat this procedure approx. 20 times. For optimal results, the wheels should not be allowed to lock.

Please do not touch the brake disc while it is rotating or directly after braking. Otherwise injuries or burns may result.
Air bubbles in hydraulic disc brakes

Avoid permanently braking for long periods, as can be the case during long, steep descents. Otherwise, bubbles may form and a total failure of the braking system may occur. Severe falls and injuries may result.

The brake lever may not be applied if the pedelec is on its side or upside down. Otherwise air bubbles can enter the hydraulic system which could cause the brakes to fail. After transporting the pedelec, check if the pressure point of the brakes seems softer than before. Then slowly apply the brake a few times. By doing this, air can be discharged from the brake system. If the pressure point remains soft, please do not use your pedelec and ask a specialist to remove the air from the brake.

You can avoid this problem by applying the brake lever before transporting your pedelec and then fixing it in this position using a strap. This prevents air from entering into the hydraulic system.

When you come to cleaning the braking system, please first read and follow the instructions provided by the component manufacturer.

In particular, brake discs are subject to wear. Have these safety-related components regularly checked for wear and changed as required by your specialist retailer.

Gear change

This operating manual describes the use of common commercial gear components on a pedelec as an example. If your components are different, you will find specific information in the respective operating manual or on the website of the manufacturer.

If you have any questions about assembling, maintaining, setting up or operating the gears, please contact your specialist retailer.

The gear shifters regulate the necessary cycling power and speed. Using lower gears makes cycling uphill easier and reduces physical exertion when pedalling. While riding in higher gears, more physical exertion is needed to pedal, allowing you to reach higher speeds with lower pedalling cadence.

In general, you should strive to ride at a higher pedalling frequency and in lower gears. Modern pedelecs can be equipped with a variety of different gear systems.
The gear lever can be operated as shown in this example:

Lever (A): Changing to a larger rear sprocket.
Lever (B): Changing to a smaller rear sprocket.
Lever (a): Changing to a larger chain ring.
Lever (b): Changing to a smaller chain ring.

All levers return to their original position after being released.

SRAM® racing bike gear shifters are operated differently. A RED shifter serves as an example here:

The shifter behind the left hand brake lever switches the chain onto the small chain wheel at the front over its short travel and onto the large chain wheel with the longer travel.

**Hub gear shift system**

The operating instructions as well as procedure for removing/fitting the system in the case of a puncture are provided in the enclosed operating instructions. It is certainly also helpful if your specialist retailer explains the functionality to you and demonstrates removing/fitting the system.

**Gears are components that are vital to your safety. Please read the enclosed operating instructions supplied to by your manufacturer and familiarise yourself with how to operate the pedelec and switch gears before your first ride. Allow your specialist retailer to undertake any work on your pedelec’s gears! Work that is improperly carried out is a risk to your safety on the pedelec!**

Do not pedal backwards while changing gears as this could damage the gear system. Changes to your gears should only be made in small steps and with the greatest of care. Incorrect setup work can lead to the pedelec chain coming off the sprockets and causing a fall. If you are at all unsure, contact a specialist retailer for help.
Despite a perfectly set up chain gear system, a pedelec chain crossing at an angle can lead to noises during riding. These noises are normal and do not cause any damage to the gear components. With less angled running of the pedelec chain in a different gear, this noise will no longer appear.

The use of spoke guards is recommended and may be mandatory in some cases. Otherwise, only minor setup errors could lead to the pedelec chain or the entire rear derailleur falling between the sprockets and the spokes.

**Electrical/electronic gear shifting system**

If your pedelec is equipped with an electronic gear-shifting system, please read the attached manufacturer’s instruction manual concerning the use and maintenance of this component. Allow a specialist retailer to work on the electronic circuit. Ask a specialist retailer to inform you about the use and maintenance of this part.

Modern pedelec technology is highly efficient but sensitive. You should service your pedelec on a regular basis. This requires specialist knowledge and special tools. Have your specialist retailer perform any work on your pedelec! You can get more information about your pedelec’s parts as well as cleaning and maintenance in the operating manual provided by your manufacturer or on the manufacturer’s website.

Work which you are able to carry out yourself with no risk to safety is printed in bold. Sustainable safe function and retention of warranty claims require that you:

- Clean your pedelec after every ride and check it for possible damage.
- Allow a specialist retailer to carry out inspections.
- Check your pedelec every 300–500 km or every three to six months.
- Check that all screws, nuts and quick releases are secure.
- Use a torque wrench to tighten any screws!
- Service and lubricate the movable parts (except the brake surfaces) according to manufacturer information.
- Have paintwork touched up.
- Have deficient and worn parts replaced.

**Inspection plan**

Only exchange or replace parts of your pedelec with parts of the same brand and type. Otherwise, warranties or guarantees may be voided.
### Inspection timeframes and assignments

#### Before every ride with your pedelec

**Check:**
- **Spokes**
- **Rims for wear and concentricity**
- **Tires for damage and foreign bodies**
- **Quick release**
- **The functionality of the gears and suspension**
- **Brake function**
- **Hydraulic brakes: Tightness**
- **Lights**
- **Bell**
- **Tires: properly secured and correct tire pressure**
- **Checking the battery is firmly fastened**

#### After riding 200 kilometres from purchase, then at least once a year

**Check:**
- **Tires and wheels**

**Torques:**
- **Handlebar**
- **Seat post**
- **Chains**
- **Pedals**
- **Saddle**
- **All fastening screws**

**Adjust the following components:**
- **Headset**
- **Gears**
- **Brakes**
- **Spring elements**

### Every 1000 kilometres

**Check:**
- **Pedelec chain or belt drive**
- **Rear sprocket**
- **Brake pads for wear, replace if necessary**
- **Sprocket**

**Clean:**
- **Pedelec chain**
- **Rear sprocket**
- **Sprocket**

**Oil:**
- **Chain with suitable lubricant**

**Check:**
- **All screws are firmly fastened**

### Every 3000 kilometres

**Have the following checked, cleaned or replaced by a specialist retailer:**
- **Hubs**
- **Pedals**
- **Headset**
- **Gears**
- **Brakes**
- **Chain**

### After riding in wet weather

**Clean and oil:**
- **Gear system**
- **Brakes (excluding brake surfaces)**
- **Chain or belt**

---

**Ask your specialist retailer for suitable lubricants. Not all lubricants are suitable for all purposes. Using the wrong lubricant may lead to damage and reduced functionality!**

---

**The first inspection is particularly important for ensuring that your pedelec remains safe and problem-free! Cables and spokes stretch, and bolted connections may come loose. Please always allow a specialist retailer to carry out the first inspection.**
Lubricant schedule

Working on the pedelec requires special knowledge, experience and special tools! Only allow experts or specialist pedelec retailers to work or check key parts on the pedelec!

Lubrication plan

<table>
<thead>
<tr>
<th>What must be lubricated?</th>

</tbody>
</table>
Bolted connections

It is vital that all bolted connections on the pedelec have the correct torque in order to ensure that they are secure. Too much tightening torque may damage the screw, nut or component. You must use a torque wrench. You cannot properly tighten the bolted connections without this special tool!

Adhere to any specified torque values where indicated for components. Please read the instructions provided by the manufacturer, which lists the correct mounting torques.

<table>

Loose accessories

You always have to fit the enclosed accessories in line with the guidelines and instructions. You have to ensure that screwed connections are secured with the correct torque (see page 39 “Bolted connections”)
• Only use add-on parts which satisfy the requirements of the applicable legal guidelines and road traffic regulations.
• Using unpermitted accessories can result in accidents. You should therefore only use original accessories and add-on parts which fit your pedelec.
• Allow your specialist retailer to advise you.

Luggage rack

Only install baggage racks on pedelecs which are suitable for this kind of equipment. Use only the intended fixing devices. Never attach a baggage rack to the seat post! It is not designed for this purpose. Overloading of the seat post by a luggage rack can break the seat post and lead to serious accidents.

When loading, please make sure not to cover the front or rear lights or reflectors!

Avoid uneven loading of the luggage racks.

Not all parts and frames made out of carbon can be combined! Read the manufacturer’s manual and ask your specialist retailer.

Race bar attachments

The seat and handlebar position of time trial and triathlon bikes is considerably different from that of conventional racing bikes. Please allow specialists to advise you on the seating position of your time trial or triathlon bike.
Mounted accessories

Accessories / maintenance / spare parts

Lighting system
Your pedelec is fitted with modern lighting technology. In addition to the conventional features, it also offers you safety functions such as a standlight. This means that if you are stationary at night, e.g. at a traffic light, you are still visible to other public road traffic participants. Equally, some models are equipped with the newly developed daytime lights. These are supplied by various energy sources depending on the riding situation. For more on this, please read the instructions supplied by the component manufacturer.

Clean the reflectors and headlights of the lighting system at regular intervals! Warm water and washing up liquid suffice for this job. Keep contact points clean and conductive with a suitable maintenance oil!

Please read the operating instructions supplied for your light system.

The lighting system is key and it is vital that it is proper working condition. Only have check-up and servicing work done by authorised specialist retailers after failures or temporary problems!

Bike lights
The type of replacement light bulbs depend on the lighting system installed in your pedelec. The following list provides a guide for finding the right bulb.

<table>
<thead>
<tr>
<th>Lighting used</th>
<th>Bulb information</th>
</tr>
</thead>
<tbody>
<tr>

Riding with luggage

Luggage load changes the behaviour of your pedelec. It extends the braking distance, among other things. This may lead to severe accidents. Please adjust your riding style to this, i.e. brake earlier and anticipate more sluggish steering. Only transport baggage on racks intended for this purpose! Never attach a baggage rack to the seat post! It is not designed for this purpose. Overloading of the seat post by a luggage rack can break the seat post and lead to serious accidents!

• Only mount child seats on baggage racks if they have the corresponding holders and the manufacturers permit this.
• Please ensure that nothing can get caught in the spokes and spinning wheels.
If you are riding with baggage, ensure that you do not exceed the maximum permissible weight of the pedelec (see page D). Information on the load-bearing capacity of the rack is also stated here.

When loading luggage racks, please make sure not to cover the front or rear lights or reflectors!

Avoid uneven loading.

**Front-wheel luggage carriers**

Front racks should be attached to the front axle or the front fork. Front racks have a strong impact on the pedelec’s behaviour! Please practice riding with a loaded front rack in a safe area before your first journey!

**Mudguards**

Mudguards are fixed correctly in place with special braces. If the inside of the mudguard runs parallel to the tyre forming a ring shape, the braces are perfectly positioned. During normal use, the mudguard should not loosen. The mudguard is fitted with a safety fastening in case an object jams between the mudguard and the tyre. This releases the mudguard from its holder to prevent a fall.

You must stop cycling immediately if a foreign body is trapped between the tyre and the mudguard. Foreign bodies must be removed before you can continue on your ride. Otherwise, there is a risk of a fall and serious injuries.

On no account should you continue riding with a loose mudguard brace, as this could become wedged in the wheel and jam it.

Damaged mudguards must be replaced by a specialist retailer before riding again. In addition, you should also regularly check whether the braces are fixed securely in the safety releases.

**Re-locking a safety release**

The diagram features a brace attached with a plastic clip.

- This clip is locked into the stay on the fork.
- The mudguards are aligned in such a way that they do not contact the tyres.

Find out whether your pedelec is approved for use with a trailer. This should have been filled in by your seller on the “Hand-over documentation” page.

Only use trailers that have been approved. Look for a seal of quality like the GS symbol. Ask your specialist retailer for advice, and have the required coupling safely installed by them.

Notice that trailers make the pedelec much longer than usual. Riding a pedelec around corners with a trailer is different to riding without. You must keep this in mind when riding in traffic. Before riding on public roads, practise riding your bike with an empty trailer in a safe and quiet environment.
Read the manufacturer’s operating manual, which often contains important information regarding riding with a trailer. Please take a look at the corresponding website. Check whether the manufacturer provides a maximum permitted weight and a maximum permitted speed. If so, these values must be adhered to. Children under 16 are not legally permitted to ride a bike with a trailer in Germany.

Trailers are permitted for pedelecs. Load trailers are not legally prohibited for speed pedelecs, but only couplings with an approved design should be used (see also Guidelines for part replacement, page 48).

### How to use carbon components

If you have a carbon frame or parts, these should not be applied with grease or oil. Please use special assembly paste for carbon parts.

![Special assembly paste](image)

Carbon fibre is a material that requires special handling and care when making the wheel, during servicing, when riding and also during transportation and storage.

### Properties of carbon

The term carbon is colloquially used for a composite material consisting of carbon fibres embedded in several layers in a plastic matrix. The material is very light yet highly resilient, but it is susceptible to impacts and dents.

Carbon parts cannot be bent, dented or misshapen after an accident/fall. If this is the case, it is possible that the fibres have been destroyed or have broken off, e.g. within the part, which is not visible from the exterior! Therefore, it is vital to regularly check carbon frames and other carbon components very carefully, especially after a fall or an accident.

- Look for splinters, tears, deep scratches, holes or other changes in the carbon surface.
- Check if the parts have got softer or less stiff than usual.
- Check if individual layers (paint, finish or fibres) come off.
- Listen for any cracking or other usual sounds. If you are not completely certain that your pedelec is in perfect condition, please allow a specialist retailer to check the affected carbon parts!
Some carbon components require lower torques than metal parts. Excessive torques can lead to hidden damage, which is possibly not visible from the outside. Frames or components can break or warp to such an extent that you could fall. Therefore please always adhere to the instructions supplied by the manufacturer or ask for advice from a specialist. Use a torque spanner to ensure that you get the required torque.

Carbon parts may not be applied with grease or oil. Special assembly paste is available for assembling and safely securing carbon components with a low mounting torque. Never expose carbon parts to high temperatures! Even in the back of cars, the sun’s rays can generate such a heat that it can put the safety of carbon parts at risk.

Do not clamp a carbon frame directly into a work stand, instead you should secure it by the seat post. If the seat post is also made of carbon, use another tube made of metal.

The following components and parts made of carbon should be regularly checked (at least every 100 km) for irregularities such as cracks, breaks or changes to the surface as well as after the pedelec has fallen over or following an accident:

- Transition area of the threaded bushing of the bottle cage, slot of the dropouts, bearing areas in full-suspension frame, suspension mounting elements on the main frame and rear suspension, seat clamp, derailleur hanger, derailleur clamp area, disc brake mounting or brake boss, press-fit area of the headset as well as the threads of the bottom bracket cups.

If the parts are made out of composite materials, the rider may not notice any damage. Parts made out of composite materials should either be sent to the manufacturer for inspection or replaced and disposed of in the event of possible damage.

Transporting the bike

The battery is not considered a hazardous material when transported to operate the pedelec. The battery becomes a hazardous material when it is transported any other way. In this case, you must follow the appropriate guidelines.

Before transporting, remove the battery of your pedelec / e-bike if possible and transport it separately.

Never send the battery yourself. Batteries are considered hazardous materials. Only send the battery of your Pedelec via your specialist dealer. In some circumstances, it can overheat and catch fire.

By car

You can transport your pedelec by car as you would a normal bicycle. Before transporting, remove the battery of your pedelec / e-bike if possible and transport it separately. The weight of the Pedelec will call for a heavier-duty rack. Always adjust your driving behaviour to the load you are carrying. You should only use roof and rear racks that comply with the requirements of the relevant regulatory authorities. Roof, rear and other racks that are approved by the authorities are safe for use in traffic.
They must have approval in accordance with road traffic licensing regulations in your country. Look for a seal of quality like the GS symbol. Inadequate bicycle racks may cause accidents. Always adjust your riding behaviour to the load you are carrying.

Carefully attach the pedelec, so that it cannot come detached from the rack. This could result in severe traffic accidents. Check the fasteners multiple times during transport. Loose parts (e.g. tools, air pumps, bags or child seats) may come off during the drive and put other motorists at risk. Remove all loose parts before departing. Only then may the pedelec be attached at the handlebars, stem, pedelec seat or seat post if this is intended by the rack manufacturer. Do not use fasteners that could damage the fork or the frame.

The total height of your vehicle changes when you transport a pedelec on the roof!

Never attach the pedelec to components made of carbon.

Replacing parts

*Guide for parts which may be changed on CE-approved e-bikes / pedelecs with assisted pedalling up to 25 km/h*

**Category 1**

Components allowed to be changed only with permission from the bike’s manufacturer/system provider

- Motor
- Sensors
- Electrical steering
- Electrical cables
- Control panel on the handlebars
- Display
- Battery pack
- Charger

**Category 2**

Components allowed to be changed only with permission from the bike’s manufacturer

- Frame
- Suspension strut
- Bike fork and suspension fork
- Wheel for the hub motor
- Brake system
- Brake pads (rim brakes)
- Luggage rack

(Luggage racks determine how much weight the wheel can carry. Both positive and negative changes made to the bike can potentially impact the bike’s drivability as compared to that implied by the manufacturer.)

The manufacturers of add-on components and accessories also provide information regarding use and assembly on their websites. Check it out when you use something new.

**On the train**

The same regulations apply as when transporting a bicycle. Before transporting, remove the battery of your pedelec / e-bike if possible and transport it separately.

Public transportation has different regulations regarding the carrying or transportation of pedelecs. Know which buses and trains you can take before using public transportation.

**Aircraft**

Batteries must be transported as dangerous goods. You must ensure that it is clearly labelled as such. Ask your airline about this. Also, check with your airline about the regulations regarding the transport of pedelecs.
**Category 3**
Components allowed to be changed according to the bike or bike part’s manufacturer

- **Pedal crank arm**
  (Provided that the distances/chainsets/frame centre (Q-Factor) are observed)
- **Wheel without hub motor**
  (Provided that the ETRTO is observed)
- **Chain or drive belt**
  (Provided that the original width is observed)
- **Rim tape**
  (Use the correct rim tapes for the rims) Modified combinations may result in rim tape shifting and thus in defective inner tubes)
- **Tyres**
  (Provided that the pedal is not wider than the series/original area of application)
- **Brake hoses/brake cables**
- **Brake pads**
  (Disc, roller, drum brakes)
- **Handlebar/stem unit**
  (Provided that there is no need to change the lengths of cables and/or hoses. It should be possible to change the seating position within the original hose lengths for the benefit of the consumer. Going beyond that results in a significantly changed load distribution on the wheel and could seriously affect steering)
  
  - **Saddle and seat post unit**
    (Provided that the offset to the rear does not exceed 20 mm with regard to the series/original area of application. In this case as well, modifying the load distribution beyond the intended adjustment range could seriously affect steering. The length of the saddle brace on the saddle frame as well as the saddle shape are also important)
  - **Bicycle lights**
    (Headlights are designed for a specific voltage which must be compatible with the vehicle’s rechargeable batteries. In addition, electromagnetic compatibility (EMC) must be ensured provided that the headlight may be responsible for a part of the potential interference)
  - **Sprockets and derailleur cassettes**
    *The manufacturer of the part can only approve a component if it was tested in accordance with its intended use and with standards beforehand. A risk analysis must also have been performed.

**Category 4**
Components not requiring any special kind of approval to be changed

- **Headset bearings**
- **Bottom bracket**
- **Pedals**
  (Provided that the pedal is not wider than the series/original area of application)
- **Derailleur**
- **Rear derailleur**
  (All gear change parts must be suitable for the number of gears and be compatible with one another)
- **Gear lever**
- **Gear cables and housings**
- **Chain rings/belt pulleys/sprockets**
  (Provided that the number of teeth and the diameter is identical to the series/original area of application)
- **Chain guard**
- **Mudguards**
  (Provided that the width is not smaller than the series/original parts and the distance to the tyre is at least 10 mm)
- **Spokes**
- **Inner tube of the same type with the same valve**
- **Dynamo**
- **Rear light**
- **Reflector**
- **Spoke reflectors**
- **Bike stand**
- **Grips with screw clamps**
- **Bell**

**Category 5**
Special notes for mounting accessories

- **Rear view mirrors are allowed.**
- **Additional battery/rechargeable battery-operated headlights are permitted in accordance with § 67 StVZO (Germany’s Road Traffic Licensing Regulations).**
- **Trailers are only permitted after approval by the vehicle manufacturer.**
- **Child seats are only permitted after approval by the vehicle manufacturer.**
- **Front baskets are not recommended due to the undefined load distribution. Only permitted after approval by the vehicle manufacturer.**
• Bicycle bags and top cases are permitted. Respect the maximum permissible weight, the maximum load of the rack and the load distribution.
• Attached weather protectors are only permitted after approval by the vehicle manufacturer.
• Front and rear luggage racks are only permitted after approval by the vehicle manufacturer.

Guidelines for replacing parts of e-bikes / Pedelecs with pedalling assistance up to 45 km/h

Category 1

Important basic information
• Speed e-bikes with a motor assistance of up to 45 km/h are considered motor vehicles and subject to the EU Directive 2002/24/EC or the EU Regulation No. 168/2013.
• Depending on the vehicle, there may be different requirements which must be strictly observed when replacing a part. Therefore, always check the indications given in the vehicle documents prior to doing any work on the vehicles.
• Note: At present, vehicles with an individual operating licence are mainly subject to the regulations of the EU Directive 2002/24/EC.
• All parts which are not included in the list may only be replaced by original spare parts of the vehicle and/or parts manufacturer.

Category 2

Components which may only be replaced upon presentation of a valid test report (parts approval (ABE, EC, ECE) or part certificate*).
• Brake systems
• Brake disks/brake cables/brake pads (Only with valid type approval in accordance with ECE-R 90 or general operating licence).
• Handlebar-stem unit (Provided that there is no need to change the lengths of cables and/or hoses. It should be possible to change the seating position within the original hose lengths for the benefit of the consumer. Going beyond that results in a significantly changed load distribution on the pedelec and could seriously affect steering).
• Seat post (Provided that the offset to the rear does not exceed 20 mm with regard to the series/original area of application. It should be noted that modifying the load distribution beyond the intended adjustment range could seriously affect steering. The length of the saddle brace on the saddle frame as well as the saddle shape are also important).
• Bicycle lights (Only with valid type approval, identical mounting position as well as an EMC certificate).
• Rear light with brake light and licence plate light if applicable (Only with valid type approval, identical mounting position as tested in accordance with ECE-R 50 as well as an EMC certificate).
• Rear reflector (Only with valid type approval).
• Rear-view mirror (Only if tested in accordance with ECE-R 81 and with the identical mounting position).
• Audible warning device (horn) (Only if tested in accordance with ECE-R 28 and with the identical mounting position).
• Pedals (Vehicle with 168/2013 approval).

* For components with part certificates, the area of application must be respected. Proper assembly must be certified by a test engineer or a qualified expert.

Category 3

Components which may be replaced under the conditions described below.
• Pedals (Incl. approved reflectors provided it is not wider than the series/original pedal (vehicle with 2002/24/EC approval)).
• Tyres (As specified in vehicle documents, either in accordance with ECE-R 75 or with approval of the tyre manufacturer).
• Grips with screw clamps (In this case, the vehicle width must not be modified).
• Headset bearings
• Bottom bracket
• Rear and front derailleurs (All gear change parts must be suitable for the number of gears and be compatible with one another).
• Gear lever/grip shifter (Provided that the position on the handlebars remains unchanged).
• Gear cables and housings
• Chain rings/belt pulleys/sprockets
  (Provided that the number of teeth and the di-
  ameter is identical to the series/original area
  of application).
• Chain guard
  (Provided that it is free of sharp outer edges
  and complies with the Delegated Regulation
• Mudguards
  (Provided that it is free of sharp outer edges
  and complies with the Delegated Regulation
  (EU) No. 44/2014, Annex VIII. In addition, the
  clearance to the tyre, which should be at least
  10 mm, must be taken into account).
• Spokes
  (Provided that the dimensions correspond to
  the original part).
• Inner tube
  (Provided that the design and the valve are
  identical).
• Chainset
  (Provided that the length and the dimensions,
  such as chainsets/frame centre (Q-Factor),
  are observed).
• Chain/belt
  (Provided that the original width is observed).
• Rim tape
  (Use the correct rim tapes for the rims) Modi-
  fied combinations may result in rim tape shift-
  ing and thus in defective inner tubes).
• Saddle
  (Provided that the offset to the rear does not
  exceed 20 mm with regard to the series/origin-
  al area of application. It should be noted that
  modifying the load distribution beyond the in-
  tended adjustment range could seriously affect
  steering. The length of the saddle brace on the
  saddle frame as well as the saddle shape are
  also important).

Category 4
Special notes for mounting accessories
• Additional battery/rechargeable battery-oper-
  ated headlights are not permitted
• Trailers are only permissible if a trailer load
  is registered under no. 17 of the certificate of
  conformity and a coupling device under no.
  43.1. Note: The maximum permissible trailer
  load is 50% of the towing vehicle’s unload-
  ed weight (without batteries). There are only
  50 mm ball coupling devices available.
• Transporting children in a trailer is in general
  prohibited
• Front baskets are not recommended due to the
  undefined load distribution. Only permitted af-
  ter approval by the vehicle manufacturer.
• Bicycle bags without a permanent attachment
  and top cases are permitted. Respect the max-
  imum permissible weight, the maximum load
  of the rack and the load distribution.
• Bar ends are not permitted.

Warranty and liability in the case of defects

The conditions for guarantee / liability for faults are (partially) harmo-

nised in countries that are subject to

EU law. Find out about the relevant national stipulations that apply to you.

Within the scope of EU law, the seller is liable for
material faults for at least the first two years from
the date of purchase. This includes defects that
were present at the time of purchase or handing
over. Moreover, during the first twelve months it
is assumed that the fault already existed at the
time of purchase.

Pedelecs are complex vehicles. Therefore it is re-
quired to implement all service intervals properly.
Omitting servicing puts the claim of the seller at
risk if the error could have been avoided by ser-
ving. The necessary maintenance is outlined in
the chapters of these operating instructions and
in the enclosed instructions from the component
manufacturers.

Liability for material faults does not cover nor-
mal wear and tear within the framework of use
as intended. Components of the drive and the
braking devices as well as tyres, lights and areas
of contact between the rider and the pedelec are
subject to wear due to use, as is the battery in the
case of pedelecs.
Contact your specialist dealer if your pedelec's manufacturer entitles you to additional warranty services. Read the relevant guarantee conditions for further details about the guarantee cover and on how to exercise claims under it.

In the case of a defect / possible liability claim, please contact your specialist retailer. We recommend filing all purchase receipts and inspection reports as proof for your records.

Environmental protection tips

General cleaning and maintenance
Please take the environment into account when caring for and cleaning your pedelec. You should use care and cleaning products which are biodegradable wherever possible. Please make sure that no cleaning agents are disposed of in the sewage. When cleaning the chain, use a suitable chain cleaning tool and dispose of chain lubricant properly at a suitable waste disposal site.

Brake cleaners and lubricants
Brake cleaners and lubricants are to be treated like general cleaning and maintenance agents.

Tyres and inner tubes
Tyres and inner tubes may not be put into the residual or domestic waste and have to be disposed of at your local recycling centre.

Pedelec batteries
Batteries belonging to pedelecs should be treated as hazardous and are therefore subject to compulsory special labelling. They have to be disposed of by the retailer or the manufacturer. Contact your specialist dealer.

The transport packaging of this product must not be disposed of with household waste. You can return the packaging to the sender free of charge. The aim of offering this alternative option to return the used packaging is to ensure that it is collected separately from household waste so that it can be properly recycled or reused. Please note that you may need the transport packaging if you wish to return the pedelec. Please contact the manufacturer service hotline for more information.

Legal disclosure

For questions about your pedelec, first contact your specialized retailer, then the manufacturer of the product as needed. For contact details, please refer to the warranty section, return envelope or other enclosed brand documentation from the pedelec manufacturer.

Hand-over documentation

The pedelec specified in the “vehicle identification” section was delivered to the customer in the following condition:

- **A. Fully assembled:** ready to ride
- **B. Pre-assembled:** Still to do: Install pedals, straighten, adjust and fix stem, check and adjust tire pressure.
- **C. Partly assembled:** Still to do: Tighten the pedals and handlebars with the appropriate tools taking into account the correct torque. This should be carried out by a trained professional or specialist retailer only. Check and adjust tire pressure.

The pedelec corresponds to type _________ according to the chapter “Intended Use”.

Functional check for the following components:

- Wheels: spoke tension, sturdiness, concentricity, correct tire pressure
- All screw joints: secure fit, correct tightening torque (see above: “condition on handover”)
- Light system
- Gear system
- Brake system
- Suspension adjusted to the rider
- Seat position adjusted to the rider
- The following components were assembled and checked separately:

- The assembling/inspecting party completed a test ride
- The customer was instructed on how to use the pedelec
- Right brake lever operates front brake
- Left brake lever operates front brake
- Instruction on how to fix a flat tire, how to open and close the fixtures on the driven wheel

The following operating manuals were supplied and explained:

- Pedelec
- Gear system
- Brake system
- Suspension elements
- Belt drive
- Charger
- Electric drive system manual
- Other documentation:

Unless otherwise specified, trailers, child seats and racks are not permitted, and the pedelec is not licensed for competitions.

- Permitted for trailers: yes no
- Permitted for child seats: yes no
- Permitted for luggage racks: yes no
- Permitted for competitions: yes no
- Authorized for Bike Parks: yes no

The maximum total weight for this bicycle is 100 kg. The weight may vary, especially for pedelecs, kids’ bikes and youth bikes: _________ kg (bike weight + rider + baggage + trailer).
