## ALKOflex<sup>™</sup>

One of the key strengths of the ALKOflex<sup>™</sup> product range is its user-friendliness, thanks to the smooth peel and ease of removal. Well-known brand owners of condiments, beverages, herbs, spices, and a variety of other products value the reliable protection afforded by this hermetic sealing liner.

## ALKOvin<sup>™</sup>

A perfect combination of closed-cell polyethylene foam and high-quality barrier films for protecting wine and preserving its aroma.

## ALKOseal<sup>™</sup>

ALKOseal<sup>™</sup> range of two-piece liners are sealed using induction sealing, in order to achieve a clean, hermetic seal on containers. This range of liners protect high-quality speciality coffees, spreads, and all powdered filling contents against undesirable environmental influences before and after being opened for the first time.

## ALKOvent<sup>™</sup>

Providing a bidirectional gas exchange through a liquid-tight but gas-permeable membrane. The container is reliably sealed while allowing the filling substance to "breathe". This effectively prevents any "shrinkage" or "panelling" of the container due to a vacuum or excessive overpressure.

## ALKOzell<sup>™</sup>

ALKOzell<sup>™</sup> is a closed cell expanded polyethylene (EPE) or polypropylene (EPP) foam. When inserted into aluminium or plastic closures, ALKOzell<sup>™</sup> provides a secure, durable seal for containers made from all types of materials. ALKOzell is available in a range of thicknesses and densities, and can be laminated with any of our wide range of barrier and protective films.

## ALKObond<sup>™</sup>

This two piece is held together by a special point waxing process. When the container is first opened, the secondary re-seal separates from the primary seal, breaking the wax joins. This causes a characteristic crackling sound.

## ALKOglue<sup>™</sup>

A wet glued liner that is applied to the containers land area and is suitable for sealing both plastic and glass containers. The glue layer effectively compensates for any minor unevenness in the containers land area. ALKOglue<sup>™</sup> sealing liners provide protection to coffees, spreads, cooking stock, herbs, and spices, and other powdered contents.

## ALKOsafe<sup>™</sup>

ALKOsafe<sup>™</sup> is a range of two-piece, wax-laminated liners for induction sealing for both plastic and glass containers. Products such as agricultural chemicals, engine oils, pharmaceuticals, nutraceuticals, and foodstuffs can now be securely sealed and protected from contamination and product leakage.
