Giving water a second life

Sustainable MET4grey® treatment system for greywater treatment

MET4grey

The MET4grey® system enables the sustainable and safe regeneration of greywater generated by showers and washbasins. The water is collected by gravity in a tank before passing through three modular biofilters, where natural electroactive microorganisms remove organic pollutants and generate nitrate, a natural fertilizer. Finally, the regenerated water is disinfected, stored and ready for reuse in watering green areas, street cleaning or toilet cistern flushing. With just one square metre of surface area, we can regenerate the water produced by 30 people.
