BEHIND THE BUILD

# How it *works.*

We're the team you hire when you need a connected product, but don't want to assemble a firmware, cloud and frontend team from scratch.

## WHY REBELS

### One vendor 01

Firmware, connectivity, cloud, dashboards, device management. Full stack, one team. We own the delivery end-to-end.

### Faster delivery 02

Our own open source building blocks and AI-assisted engineering mean less time on infrastructure, more time to customise the platform for your needs.

### Open source 03

Your platform is built on OpenThings, fully open source. Your code, your infrastructure. Cloud agnostic, self-hostable, and secure by default.

## OUR PROCESS

1 **We design it**

You get a clear architecture and a fixed-price proposal before we start building. We workshop your requirements, map the system, and define exactly what we'll deliver.

2 **We build it**

We build the platform behind your connected product, from sensor to screen. One team, full stack, secure by design. Our own open source tools and AI-assisted engineering mean your project doesn't start from scratch.

3 **We keep it running**

We stay with your platform long-term. Monitoring, updates, scaling, SLA. We run your platform. You run your business.

## TALK TO US IF

- ☑ You're building (or planning) a connected product
- ☑ You have an existing platform that's not scaling
- ☑ You need the platform, but don't want to build the team

Let's talk.
