

Clinical Review of the Product Range

Lenora Fitzgerald, MSc (Hons), cANP Wound Management, Older Person
Services, Waterford

“I am a Tissue Viability Nurse, and on my journey to this position I studied and worked as a Community Infection Prevention and Control (IPC) Nurse. I believed in the symbiotic relationship of good IPC practices and positive wound management outcomes. I came across CMC Hygea at a National IPC nurse meeting, and this innovative idea about integrating silver antimicrobial technology into patient care vessels really inspired me and confirmed my motivation that having IPC experience had huge potential to provide safe care for patients with wounds.

As already identified I worked in the community setting, providing wound management care to patients in their own home and in health centre setting. I am intensely aware of the importance of providing a clean environment, clean equipment and my responsibility of good Hand Hygiene practice to protect patients from exposure to any potential contamination of wounds. All wounds, acute and chronic, require this adherence to best practice to support positive outcomes and preserve patient wellness.

Wound hygiene practices are paramount in best practice, and I have had a positive experience with PathAguard ABLiS and LUCA vessels and liners. I have felt comfortable washing leg ulcers in home environment (where environments may not always have been ideal) and clinic environment, with positive patient outcomes. Patients are happy to have legs washed, especially where wound exudate and odour are a concern, and improvements are seen in supporting safe wound hygiene, managing odour successfully and supporting improved wound healing outcomes. I believe in this innovative technology to deliver safe patient care, and I am especially aware of this responsibility in my present role as TVN for Older Person's services.”
