migration center  
FIRST IN MIGRATION TECHNOLOGY

migration-center is not only a product but rather a content migration platform for complex migration scenarios that is designed to help customers reduce costs, manage risks, increase productivity, and accelerate the go-live of enterprise content management (ECM) applications.

## FOR WHICH USE CASES IS MIGRATION-CENTER SUITED?

migration-center offers support for a wide variety of use cases, for instance, replacing old systems and introducing new ones, consolidating systems after an M&A process, retaining inactive data in an enterprise archive, and a whole lot more.

### Migrate

Migrate from your legacy ECM system to the latest version, from your legacy solutions to new ECM solutions, or from on-premises to off-premises systems.

### Replace

Initially fill new ECM solutions by migrating content from file shares, legacy, or third-party products.

### Consolidate

Consolidate repositories to reduce the total cost of ownership or to realize a single-technology strategy.

### Archive

Archive data to an enterprise archive to decommission legacy applications, e-mails to an enterprise archive, or data to backup and recovery repositories.

### Extend | Rollout

Extend a platform by migrating content from file shares to ECM systems or by migrating content from legacy or third-party products to a new ECM platform.

### Enhance quality | Data cleansing

Reorganize folder structures and access permissions, enhance the quality of metadata, or restructure the object model within existing repositories.

### Scheduled ingestion

Manage system integration through scheduled and secure content migration

### Manage mergers & acquisitions (M&A)

Integrate and harmonize content after mergers and acquisitions

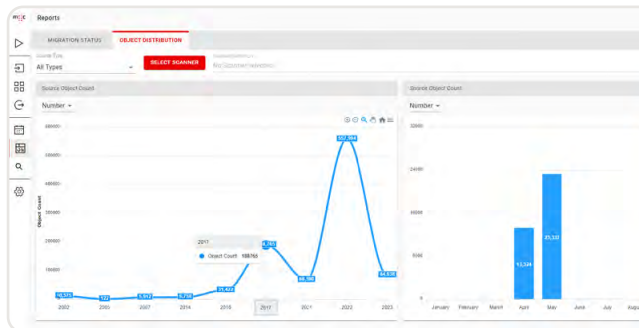

## WHICH SYSTEMS AND PLATFORMS DOES MIGRATION-CENTER SUPPORT?

migration-center supports over 250 different migration paths (combination of source and target systems). If a system is not supported out-of-the-box, the sophisticated database connector can be used in most cases.

## WHAT FEATURES DOES MIGRATION-CENTER PROVIDE?

migration-center provides lots of features specifically designed to meet the requirements of complex migration projects, such as metadata mapping and transformation, no business downtime, performance scalability, and many more.

### Performance & scalability

Input data is analyzed and organized into contextually consistent and manageable data sets. Duplicates are identified and reported. No volume restrictions exist while at the same time high performance handling is guaranteed. Multiple and parallel set processing is another outstanding feature, allowing different analysts to work in parallel. Mass operations run in the background on scalable components.

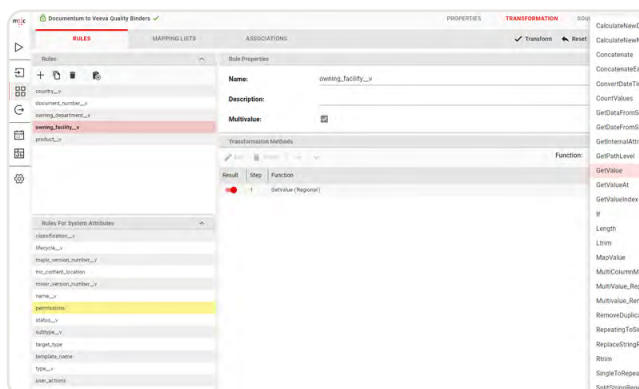

### Successive delta migrations

Successive delta scanning of source systems permits migration activities on live data without affecting daily business operations. migration-center automatically picks up any changes to source repositories and integrates them into the migration process.

### Open connectivity architecture

migration-center grants out-of-the-box connectors to many popular applications like OpenText Documentum, Microsoft SharePoint, Veeva Vault, Hyland OnBase, file shares, and many more. The open architecture allows the connection of virtually any source to any target system via the migration-center Framework and API.

### Metadata transformation & reclassification

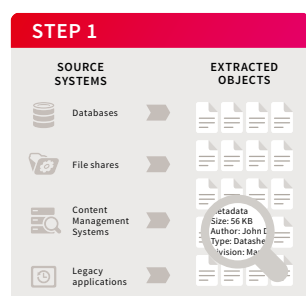

Object attributes (metadata) are transformed using functions. An unlimited number of functions may be inserted per attribute. The output of one function can be used as the input for another, which allows for highly complex transformation rules. Thus, individual rules for every data set can be defined, that specify metadata extraction and transformation as required by the target system, the assignment of folder location, document links and access permissions, relations, and much more.

In addition to these outstanding features, migration-center also offers the following capabilities:

- ✓ Predefined migration approach
- ✓ Real-time simulation & test
- ✓ Flexibility & reusability
- ✓ Unlimited application areas
- ✓ Fit for regulated environments (traceability)
- ✓ Cost efficiency
- ✓ Professional product support
- ✓ Artificial intelligence-based classification

# HOW DOES THE MIGRATION PROCESS TAKE PLACE WITH MIGRATION-CENTER?

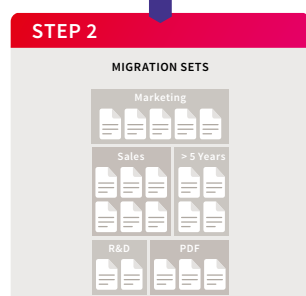

migration-center follows a clearly structured and iterative six-step process for the extraction, transformation, validation, and injection of documents, which ensures efficient and concise processing of the content to be migrated.

## Extract & analyze

All objects to be migrated to the target system(s) are exported from their corresponding source system and can be analyzed in terms of type, format, metadata, and other properties.

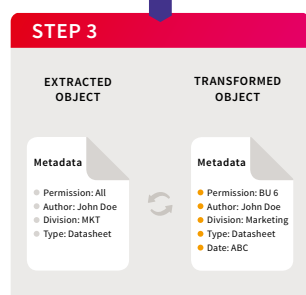

- ✓ Extract documents and metadata from various sources using one standardized process
- ✓ Analyze all metadata in detail directly after the export into migration-center

## Organize

The objects are now organized into manageable sets. Such a set is usually created from objects that have something in common and are to be processed in the same or a similar way.

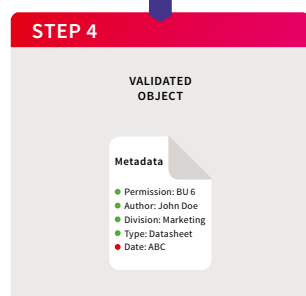

- ✓ Organize your migration sets by any category or metadata, such as data type, organizational unit, or priority
- ✓ Apply unique transformation rules and attribute mappings for each migration set

## Transform & map

Transformation rules are assigned to each migration set, which are used to generate the properties for the target system(s). The transformation is executed within migration-center.

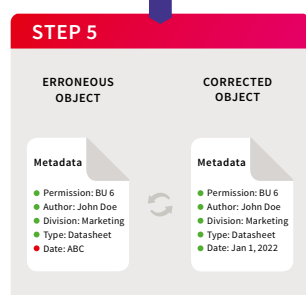

- ✓ Create custom object type attributes through user-friendly transformation rules
- ✓ Use functions like merge, concat, or split to define metadata as required to fit the target system's attribute model

## Validate

The transformed metadata of the documents is tested and validated against the target system but without importing the objects.

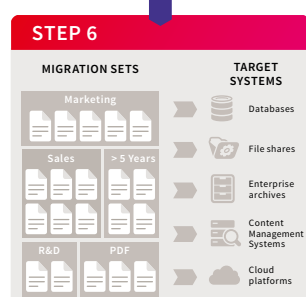

- ✓ Validate new metadata against the object type definition of the target repository
- ✓ Ensure the correctness of the attribute values before importing any documents

## Correct

Potential errors are detected during the transformation and validation steps and can be corrected in unlimited iterations of step 3 and 4.

- ✓ Avoid time-consuming trial and error approaches with rollbacks from the target systems
- ✓ Configure and prepare the migration sets step by step until they are error-free and ready to be imported

## Import

The transformed and validated objects are gradually imported into the target system(s).

- ✓ Use a transactional process to properly import documents into the target system
- ✓ Easily identify left-over errors during the import through highlighting

## WHICH MIGRATION SERVICES SUPPORT YOUR USE CASE?

Engage the expertise of our Migration Services team to guide you through all stages of your document migration. From the initial Proof of Concept to the analysis of your content, and on to the planning and execution of your migration project.

**Migration factory**  
Dealing with lots of similar migrations? Applying a factory assessment with a highly reusable setup together with our experts will significantly reduce costs and execution time.

**Application decommissioning & archiving**  
Connect with our specialized consultants to define a strategy for intelligent archiving and (application) decommissioning. Keep pace with regulatory challenges while saving IT budget .

**Workplace modernization**  
One of our main business cases is helping our clients transition their workforce to modern, cloud-based platforms that streamline the user experience and increase employee efficiency.

**Data cleansing & reorganization**  
Over the years, the quality of content and meta-data often degrades, affecting IT spending and workforce efficiency. We help you to leverage migration capabilities to get rid of unnecessary data.

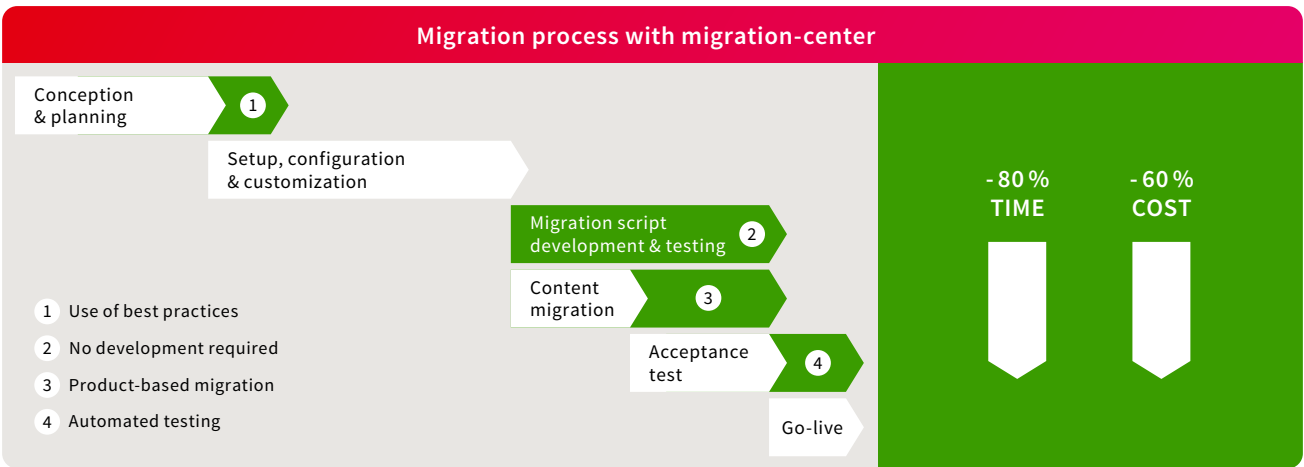

**Computer System Validation**  
We enhance the migration process by providing a validation package with document templates that are required in a GxP validation process along with services to adapt the templates.

**Migrating legacy systems**  
Migrate legacy systems without out-of-the-box source connectors using our generic ones or let our team build a custom connector leveraging the migration-center SDK.

## WHY IS MIGRATION-CENTER SUPERIOR TO CUSTOM SCRIPTS AND FRAMEWORKS?

A common approach to migration projects is to use custom scripts and frameworks. Due to their individual development, they require a very large investment of time, are highly prone to error, and ultimately lead to significant additional costs.

Trial Version	PoC Package	Service Partnership
