Covers for water reservoirs

**covers for water
reservoirs**

 **evapo~control®**

**covers for leachate
and slurry ponds**

 **odo~control®**

**covers to generate
energy**

evapo~solar
(en fase de validación)

WE ARE

FUTURE

We came to stay. In the 7 years of life of our company a vision accompanies us, that water reservoirs are covered. That a water storage reservoir cannot be completed if it is not protected by a cover. It is a change of perspective that will reach every sector related to water sooner than later. Environmental policies, management of resources, and above all, common sense goes in that direction.

We have designed several cover systems capable of adapting to the purposes of each reservoir. After the design, there has always been a stage of independent validation in the field for periods longer than a year with the most prestigious researchers and academic entities.

In 2020 we started the commercialisation having made more than 100 installations since then, accompanying disruptive, innovative and committed companies looking for sustainability. **Do you join us?**

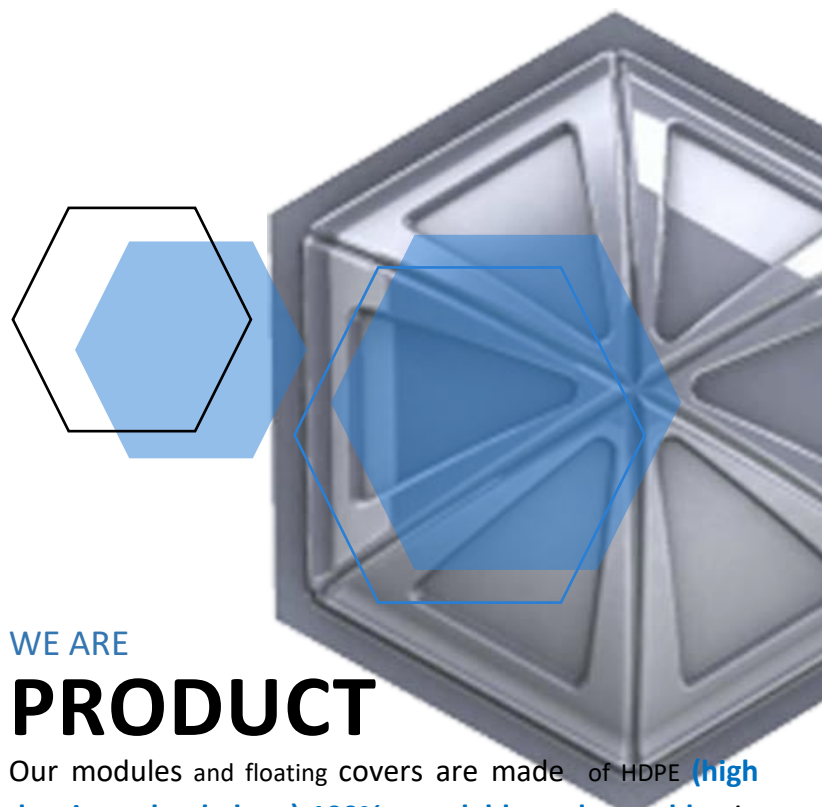

WE ARE

TECHNOLOGY

The path to reach our position has come accompanied by a complete technological development, not only from our product portfolio, but from our own innovative manufacturing process that allows us to be **the most competitive system in the market.**

We have a big production capacity in our manufacturing lines which, together with an optimized maritime-land logistics and an easy installation allow us to carry out projects anywhere in the world within weeks.

WE ARE

PRODUCT

Our modules and floating covers are made of HDPE (**high density polyethylene**) **100% recyclable and reusable**, in fact, they already incorporate 15% recycled material with post-industrial quality, however, it does not include HDPE of agricultural origin because of the residues of fertilizers and phytosanitary products that could be released. The recycled material is exclusively of its own and known origin, pure and without having participated in any polluting process. Therefore, the product has a certificate that guarantees its use with drinking water. The base material with which we manufacture is exactly the same as that of waterproofing geomembranes.

Thanks to their technology they have proven to be resistant to winds greater than 80 km/h on covered surfaces of more than 1 hectare and its useful life is greater than 15 years.

WE ARE

WARRANTY

100% satisfied customers.

From our first covered reservoir our obsession has been to solve problems to our client, not to create new ones. For this reason the development of our first product took four years before getting to the market. The main advantages of our covered are simplicity, reliability and its universality.

That has caused the product experience to be spectacular and that quickly many of our customers repeat with a second or third reservoir.

You install them and you forget, as simple as this.

At least for 15 years...

WE ARE

BENEFITS

Evapocontrol® is a solution based on isolated floating modules that makes it possible to avoid 80% of evaporation.

Odocontrol® achieves similar quotas in the reduction of emissions and odours, presenting both an installation that is very simple -just pour them directly- and an automatic adaptation to the geometry and slope of any reservoir. They rise and fall automatically adapting themselves to the emptying or any operation in the reservoir.

In addition, by suppressing the entry of light, they completely eliminate the algae that usually proliferate in the water, produce beneficial secondary effects on quality such as the reduction of salinity problems, stratification, microbiological load, solids in suspension, as well as the improvement of its thermal stability.

WE ARE

SUSTAINABILITY

We have assumed a great responsibility in the management of the water reservoirs with the aim of increasing the availability of this vital resource. We have worked very hard to obtain an efficient product, but also **sustainable over the time and respectful with the environment.**

For this reason, **Evapocontrol®** is the only product in the sector that has achieved the “**Solar Impulse Efficient Solution Label**”. It is an exclusive distinction given by the SOLAR IMPULSE FOUNDATION that aims to discover the 1.000 current more environmentally sustainable and economically viable solutions which nowadays have a significantly positive impact in the welfare of our society.

In the same way, we participate in international projects such as **BRIGAD** or **LIFE**. BRIGAD project is an innovation action of the European program H2020 which mission is to provide comprehensive support for innovation for adaptation to climate change, focused on the reduction of climatic risks such as droughts and scarcity of water resources. We are also part of the **#PorElClima Community**, a pioneering initiative of companies, organizations and public administrations with a common goal: to be protagonists of the action against Climate Change.

You are like us, **you think different, you built different.**
