

Common challenges in healthcare today

Staff shortages leave no time

No time to help patients navigate digital systems or follow up on their care between shifts.

Existing digital services go underused

Patients can't find them, don't know they exist, or default to Google and ChatGPT.

Information is everywhere — but is it right?

No nurse wants their patient searching ChatGPT for rehab advice. They want patients reading vetted, hospital-approved content.

Per-bed devices are too expensive

Providing every patient with their own dedicated device is simply not affordable at scale.

Getting the right message across is hard

The hospital's own vetted content — rehab guides, care instructions, feedback forms — goes unread while patients scroll elsewhere.

Digitalisation feels like a huge leap

Multiple systems, long projects, high costs. It can feel like there are too many steps before any real benefit is felt.

Shared tablets seem like the obvious answer.

The problem is — they don't work.

Hygiene risk

A tablet passed between patients without proper wipe protocols is a clinical liability. Most shared devices have no automated reset at all.

Every reset takes staff time

Clearing data, reconfiguring settings, managing updates — it falls to nurses and ward staff who already have no time to spare.

One size does not fit all

You can't hand a child the same tablet you gave an adult patient. Or give a rehabilitation patient the same content as someone in day surgery.

GDPR exposure

Previous patient data left on a shared device is a compliance violation waiting to happen. Manual processes are not reliable enough.

Shared devices don't work — unless you solve all of this at once.

What if every shared tablet just worked?

Open it.

Personalised content. Patient's own language. No login.

Use it.

Hospital info, entertainment, feedback — for anyone.

Share it.

Auto data wipe. GDPR by design. Ready for the next patient.

countries

400+ organisations worldwide.

Public sector. Formal
procurement. They chose Hublet
— and kept renewing.

HEALTHCARE

FI

Finland

At Laakso Laakso Hospital
Helsinki: 11/13 wards deployed.
Hublet supports patient
experience, communication, and
service delivery across the
hospital.

HEALTHCARE

DE

Germany

Europe's most demanding
healthcare market. Strict data
laws. Rigorous tendering. We
passed. If it works in Germany, it
works anywhere.

What a pilot looks like.

1

One ward.

We start in a single ward — the one where you feel digital engagement matters most. Inpatient, rehab, long-term care, waiting area.

2

A handful of tablets.

Pre-configured, ready to go. Hublet Manager set up in advance. Your staff don't need to touch IT. We handle onboarding.

3

You see it working.

Patients pick them up. Data wipes automatically between users. Staff spend zero time managing devices. You decide if you want more.

No IT project. No long procurement. No risk. Just a pilot.
