

Automate the assessment of your Active Directory security level

The solution provides insight into Active Directory compromise risks and offers recommendations for improving your organisation's cyber performance.

Today, Active Directory accounts for 70% of cyberattacks, with nearly 100 million AD accounts targeted every day. The consequences of an Active Directory breach can be disastrous for an organisation: theft of sensitive data, data corruption, interruption of operations, etc. The average cost of an AD attack is estimated at €17 million.

For these reasons, we offer our AD Rating® solution to continuously assess, manage and improve the security level of your organisation's Active Directory.

It identifies configurations and key deviations from security best practices so that you can remedy issues that could compromise your organisation's overall security level.
