Namirial eSignAnyWhere

*eSignature Workflow Orchestrator*

Going eSignAnyWhere
Empower your business

Namirial eSignAnyWhere Platform is the solution that allows **signing PDF documents** (or documents converted to PDF) in a client/server architecture. Its wide set of products and components allow selling services (and applications) for signature workflows, but also for easier signature tasks. Its client applications allow tailoring for the specific scenarios of the customer integration, e.g. to work with Hardware Signature solutions.

The eSignAnyWhere Platform utilizes specific components to **ensure the secure and encrypted management of data**. The use of advanced cryptographic components, combined with access control policies and user identity verification, guarantees secure consultation within the Namirial cloud service.

The solution is **fully integrable** through Web Services (REST API, Signature Plugins, OAuth for identification and authentication) at all stages of the process. Below is a representation of the process highlighting the components and phases that make up the service.

eSignAnyWhere platform architecture

What sets eSignAnyWhere apart?

Workflow Orchestration
Orchestrate signature workflows with sequential and/or parallel recipients.

Omnichannel orchestration
It doesn't matter if signers are internal or external, even without an account on the platform. They can be invited via email, sms or certified communication. It works with hardware designed for the PoS or for in-the-field scenario, and in remote scenarios through the web.

Flexible for Future Scenarios
A plugin architecture allows implementing new signature methods and adjustment of communication methods.

Privacy and the GDPR
The solution complies with the EU Regulation 2016/679 GDPR.

Integration
Namirial provides APIs which allows seamless integration in your own apps and allows using your own archive.

The secure data transfer channel
Encrypted documents are transmitted to the Namirial LegalSolutionDOC® preservation system via a secure channel.

Storage
The data will then be processed for regulation-compliant storage. Depending on the customer's need, data can be in on-premise datacenter, or on a SaaS environment.

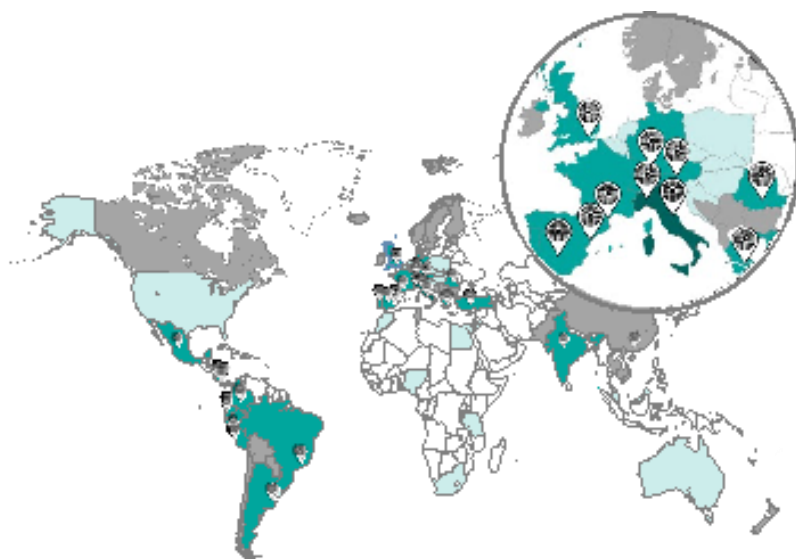

The logging and tracking of interactions
A sealed audit trail gives evidence of all activities of the signers.
