

Smart Factory
Digital Integrated Processes

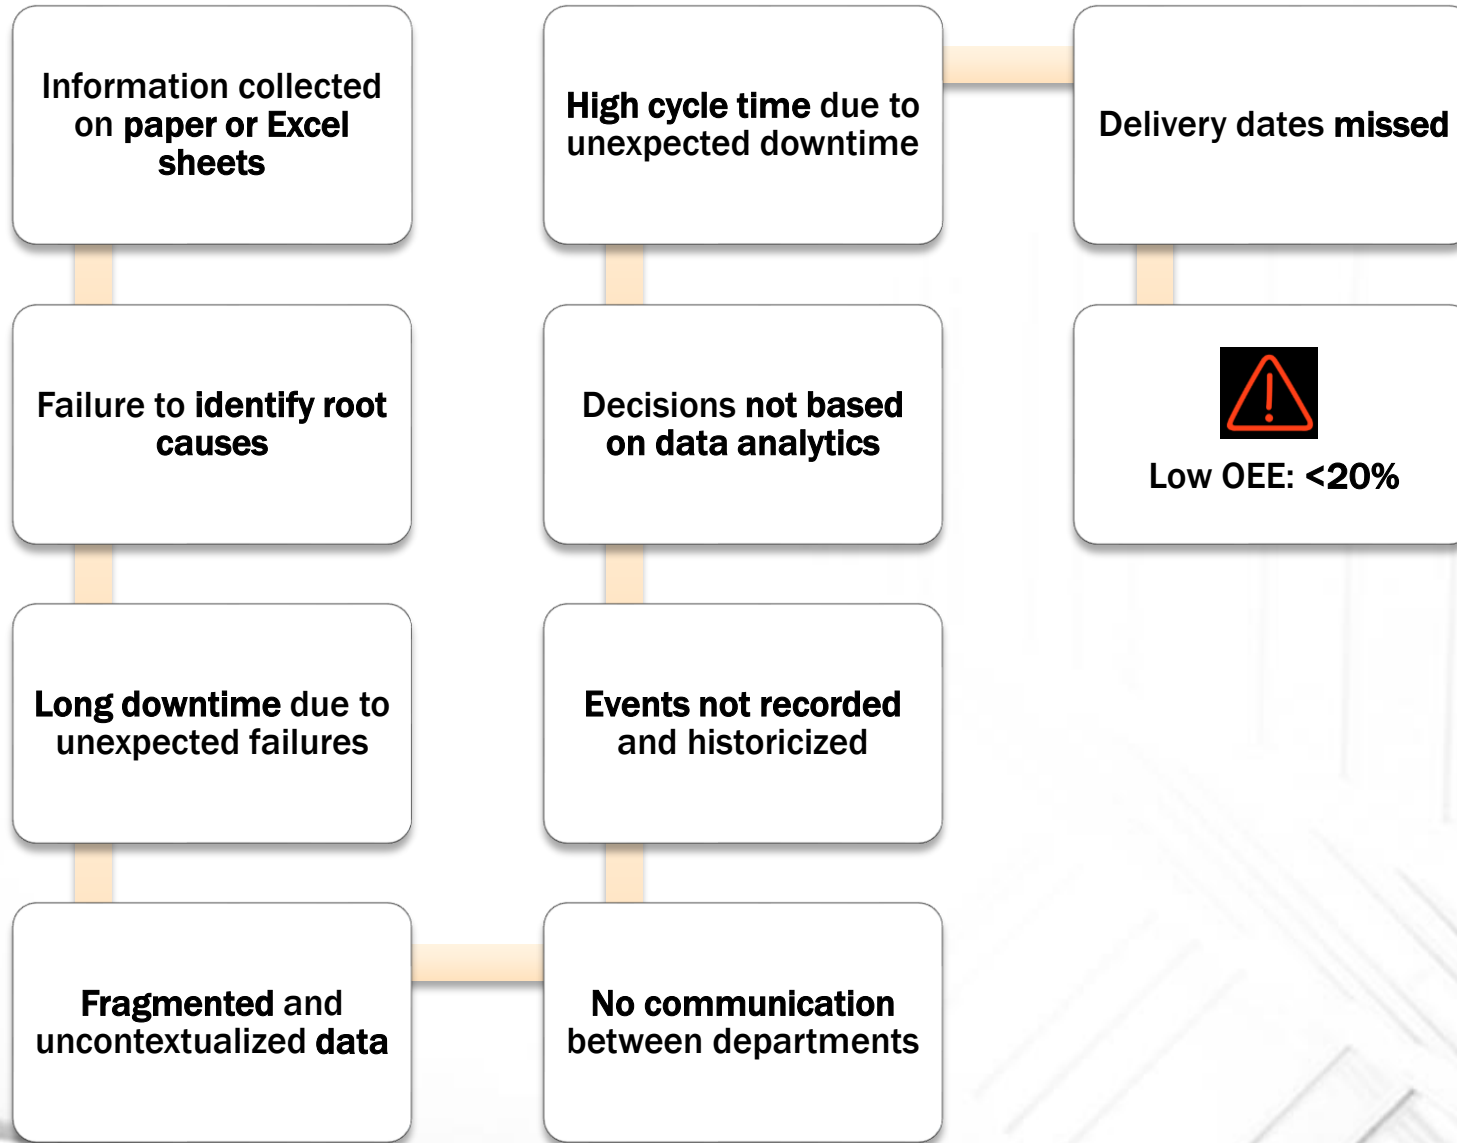

SCENARIO

- 1- Why Digitalization**
- 2- Advantage of Process Digitalization**
- 3- Data Driven Approach**
- 4- Systems Integration**
- 5- Digital Manufacturing 4.0**
- 6- Smart Factory Monitoring**
- 7- Factory of the Future in Industry 5.0**
- 8- Cybersecurity & Data Security**
- 9- Results & Continuous Improvement**

DIGITALIZATION

WHY DIGITALIZATION?

DIGITALIZATION

ADVANTAGES OF PROCESS DIGITALIZATION

1

- Lower manual operations
- Lower errors
- More time available for other activities

2

Paperless and cost reduction
(environmental awareness)

3

Compliance with regulations on
document management

4

Greater data security and
traceability

5

Fluidity and sharing of
information thanks to
integration with ERP, MES and
other web based software

6

A digital approach that allows
you to manage large volumes of
operations

7

Better customer service, with
benefits for brand reputation

8

Integrated digital system that
guides the employee in carrying
out activities

9

Traceability of operations and
guarantee of correct
management of activities, as
desired by management

DIGITALIZATION

DATA DRIVEN APPROACH

DESCRIPTIVE

What is happening?

DIAGNOSTIC

Why is happening?

PREDICTIVE

What's likely to happen?

PRESCRIPTIVE

What should I do about it?

Data driven approach is related to the analytics models used to be improved in all company integrates processes: Descriptive, Diagnostic, Predictive and Prescriptive.

A 'data driven' approach brings with it the advantage of better visibility of operations, thanks to the use of reference metrics called KPIs, Key Performance Indicators, which allow you to focus your attention on areas for potential improvement.

Accurate data in real time allows you to optimize all business processes, reduce waste and rework, improve the use of energy resources.

Through automation technologies and Industrial Internet of Things (IIoT) platforms, the collection, processing and analysis of data and their monitoring are enabled in all internal and external business processes: focus on production, maintenance and quality control.

DIGITALIZATION SYSTEMS INTEGRATION

Control of entire production areas
Smart Factory : Digital Production Systems

The "Smart Factory" concept that PM created was made possible through the software is used on different systems from well-known machine and automation manufacturers.

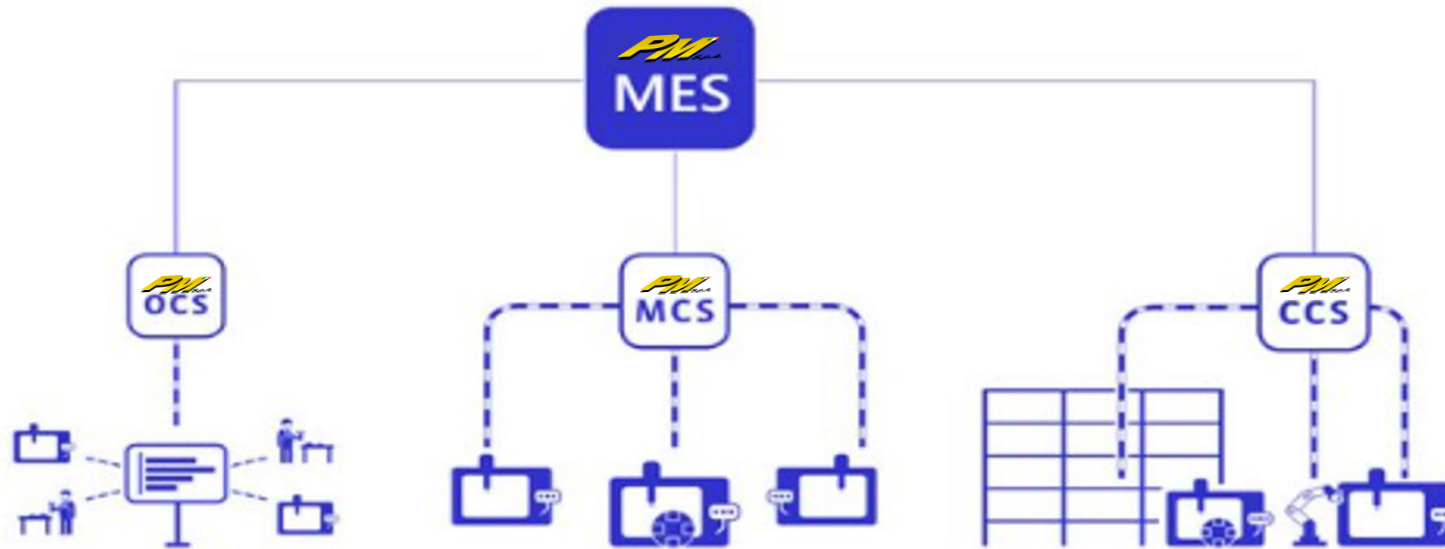

This has provided the user with a standardized solutions for production.

Operation is identical across all integrated systems used into the Company, allowing operators to have a user friendly approach with the PM IT Infrastructure and the all devices that they use everyday in their activities.

DIGITALIZATION SYSTEMS INTEGRATION

MES - MANUFACTURING EXECUTION SYSTEM
Start of digital production

MES integrates machines and manufacturing cells and thus enables a full organization and control of all manufacturing area departments.

An automated data exchange provides all necessary order information for the connected stand-alone machines and production cells.

MES is been integrated into the wall IT environment and serves as a link between the organization systems (ERP, PDM, CAD/CAM, etc.) and the machine / cell controls.

DIGITALIZATION SYSTEMS INTEGRATION

OCS - ORDER CONTROL SYSTEM

The integration between OCS (Order Control System) and ERP is the ideal entry point for detailed planning and control of order productivity on the shop floor.

OCS with AI implementation schedules production activities and organizes complex production processes easily:

- Eliminates unproductive downtime
- Reduces product transformation lead time

DIGITALIZATION SYSTEMS INTEGRATION

MCS - MACHINE CONTROL SYSTEM

MCS (Machine Control System) links processing machines with the company's administrative and technical systems like ERP, PDM, CAD / CAM, Tools Management, etc., plans and controls the machining process on an NC machine or PLC's, using the standard protocols like: MODBUS TCP, OPC UA/DA, MTCONNECT, PROFINET, EUROMAP, FANUC FOCAS, SIEMENS S7, etc.

Integration of the processing machines into the internal information flow is achieved by an automated data exchange between the higher-level organizational systems.

The process control in MCS provides all this information dynamically on demand and controls the production process at each individual machine.

The integrated digital system become the central point of information that manages the machine operations and the digital control plan also.

The operator can concentrate on his main tasks.

DIGITALIZATION SYSTEMS INTEGRATION

CCS - CELL CONTROL SYSTEM Automated Production Cells/Lines

As a compact system/cell controller, CCS is used on machining centers with pallet/workpiece handling through to complex manufacturing systems with different machines and handling systems, using a specific protocols.

CCS controls the production process by triggering workpiece, pallet, tool and fixture transports, transferring production data to the machine and starting automatic workpiece processing.

DIGITALIZATION

DIGITAL MANUFACTURING 4.0: AREA OF APPLICATION

STAND-ALONE MACHINE
MANUAL WORKSTATION

MACHINE WITH PALLET STORAGE

ROTARY LOADING SYSTEM

MACHINING CENTER WITH PALLET
TRANSPORTER

MACHINE WITH PORTAL

ROBOT CELL

HIGH RACK SYSTEM

LINEAR SYSTEM WITH ROBOT

DIGITALIZATION

SMART FACTORY MONITORING: DIGITAL LEAN MANUFACTURING CONTROL TOWER

SHOPFLOOR PERFORMANCE MANAGEMENT

DIGITALIZATION

SMART FACTORY MONITORING: SMART FACTORY CONTROL TOWER

SHOPFLOOR PERFORMANCE MANAGEMENT: **KEY BENEFITS**

REAL-TIME INTEGRATE DATA SOURCES

- Integrates all manufacturing data sources in near real-time

CENTRAL OVERVIEW

- Gives a central overview of everything that happens in manufacturing and operations in a 3D virtual twin

END-TO-END VISIBILITY

- Anticipate disruptions with end-to-end visibility
- Resolve issues quickly by triggering workflow activities

DRIVE COLLABORATION

- Drive collaboration and well-informed decisions

GAIN CAPABILITIES

- More effective scheduling & planning
- Unparalleled optimization
- Improved reactivity

SUSTAINABLE PRODUCTION

- Improved cost-saving solutions
- Real-Time energy savings optimizations and strategies

Smart Virtual Machine

- Monitoring by visual kpi on Andon systems
- Lower programming cost
- Reduce excess work in progress (WIP) and inventory
- Higher utilization
- Increased efficiency in rework if needed
- Increased manufacturing capacity and revenue

Smart Shopfloor

- Lower material cost
- Higher utilization
- Lower operational cost
- Increased efficiency in rework if needed
- Increased manufacturing capacity and revenue
- Monitoring by visual kpi on Andon systems

Smart Machine

- Faster machining
- Higher machine uptime
- Improved efficiency of manufacturing equipment
- Improve overall quality level
- Lower overall manufacturing costs
- Increased manufacturing capacity and revenue
- Monitoring by visual kpi on Andon systems
- Increased Energy Cost-Saving (Industry 5.0)

DIGITALIZATION FACTORY OF THE FUTURE IN INDUSTRY 5.0

GREEN MANUFACTURING WITH A DIGITAL TRANSFORMATION: **A SUSTAINABLE APPROACH**

Resource Optimization

We are adapt of monitoring and optimizing resource usage. Sensors can detect variations in energy and material consumption, leading to more efficient processes.

Waste Reduction

We are able significantly reduce waste by enabling precise control over manufacturing processes.

Energy Efficiency

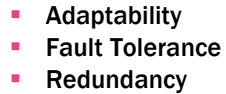

We adopt IoT and data analytics to optimize machines and adjust climate control systems in our facilities to the aim of improving energy efficiency and cost savings too.

Sustainable Materials

Our ESG roadmap: we always aim to explore and incorporate sustainable materials into our processes. By using recycled or bio-based materials, we do our best to minimize our carbon footprint.

THE THREE PRINCIPLES OF INDUSTRY 5.0

People are at the center of the process and decision-making.

- **Human-Machine Collaboration**
- **Integration of emerging Technologies**

- Green Manufacturing
- Social Responsibility
- Circular Economy

Industrial augmented reality

Cobots

Modular equipment

Computer vision

Unmanned trucks

Predictive machine analytics

Blockchain for enterprise resource planning and supply chain management

Wearables

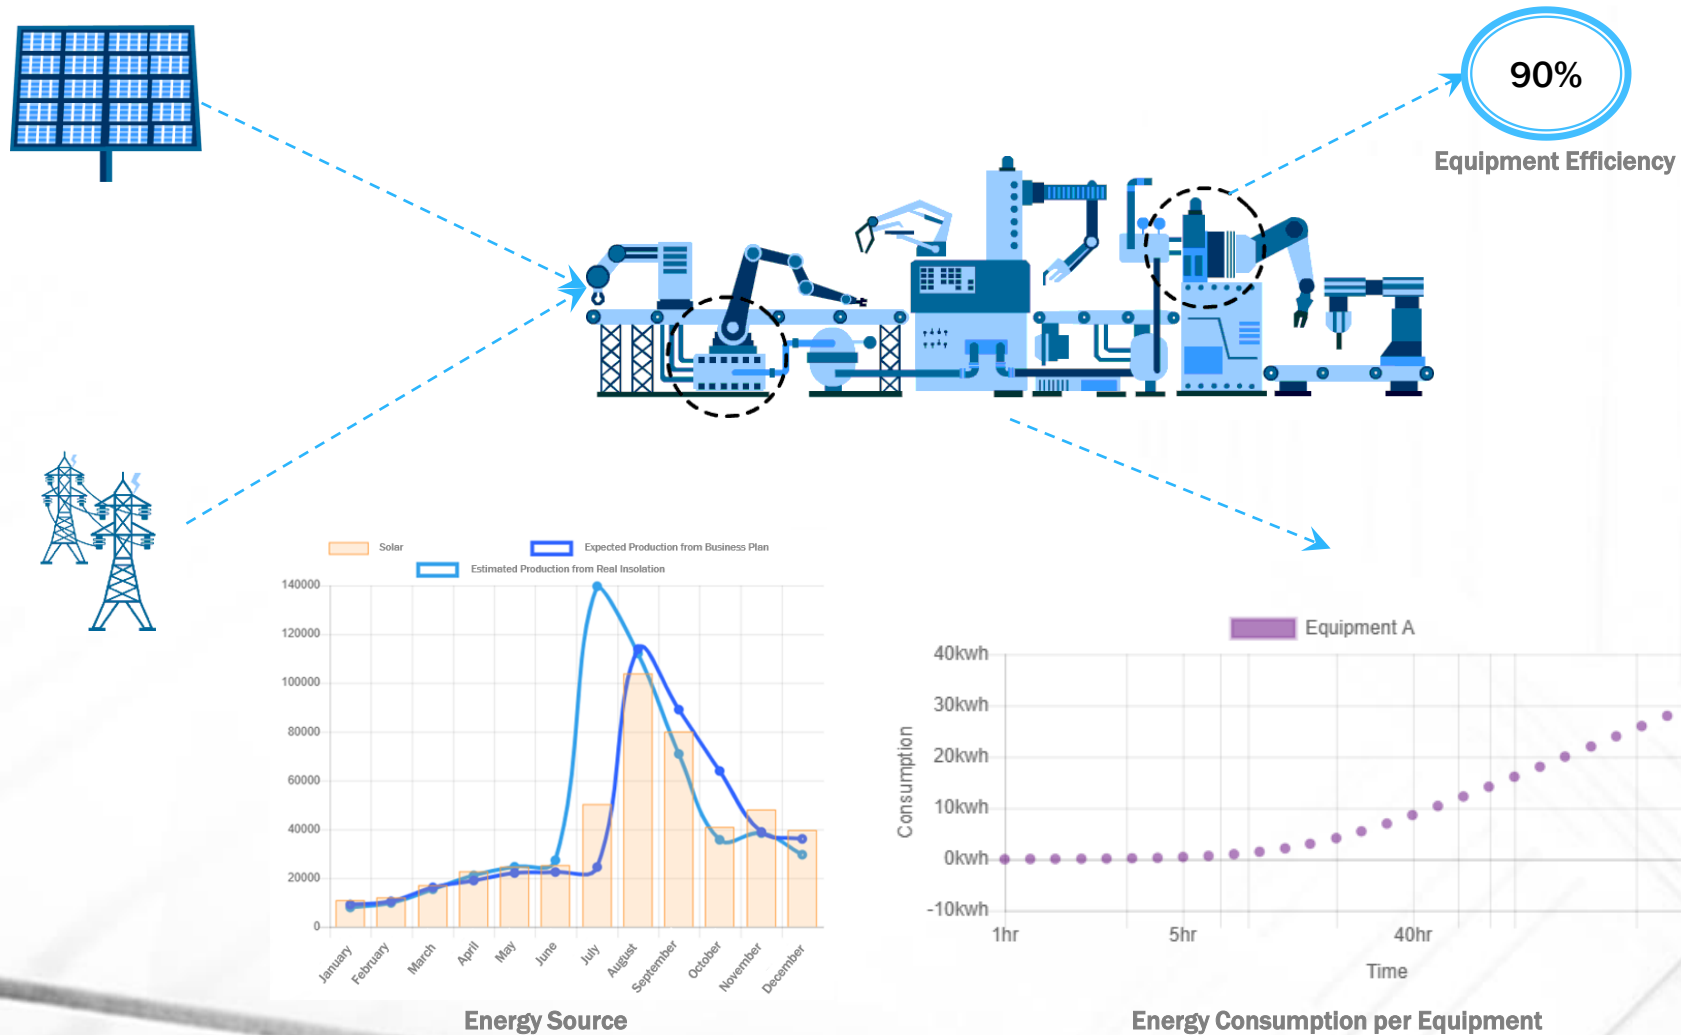

To achieve this collaboration in the workspace, Industry 5.0 is using cobots, or collaborative robots. Cobots are applied to optimize the production process and ensure work safety.

DIGITALIZATION FACTORY OF THE FUTURE IN INDUSTRY 5.0

REAL-TIME ENERGY GENERATION AND CONSUMPTION MONITORING

We have the complete visibility of energy consumption/generation into our manufacturing plants.

Monitoring allow us get detailed insights into our energy consumption not only at the manufacturing unit or building level but also at the level of line, machine and even individual product.

DIGITALIZATION CYBERSECURITY & DATA SECURITY

DATA SECURITY INTEGRATED SYSTEM: PREVENTION & DETECTION

The Company ensures the privacy and security of sensitive data through robust encryption and secure access protocols; maintains compliance with data protection regulations and standards

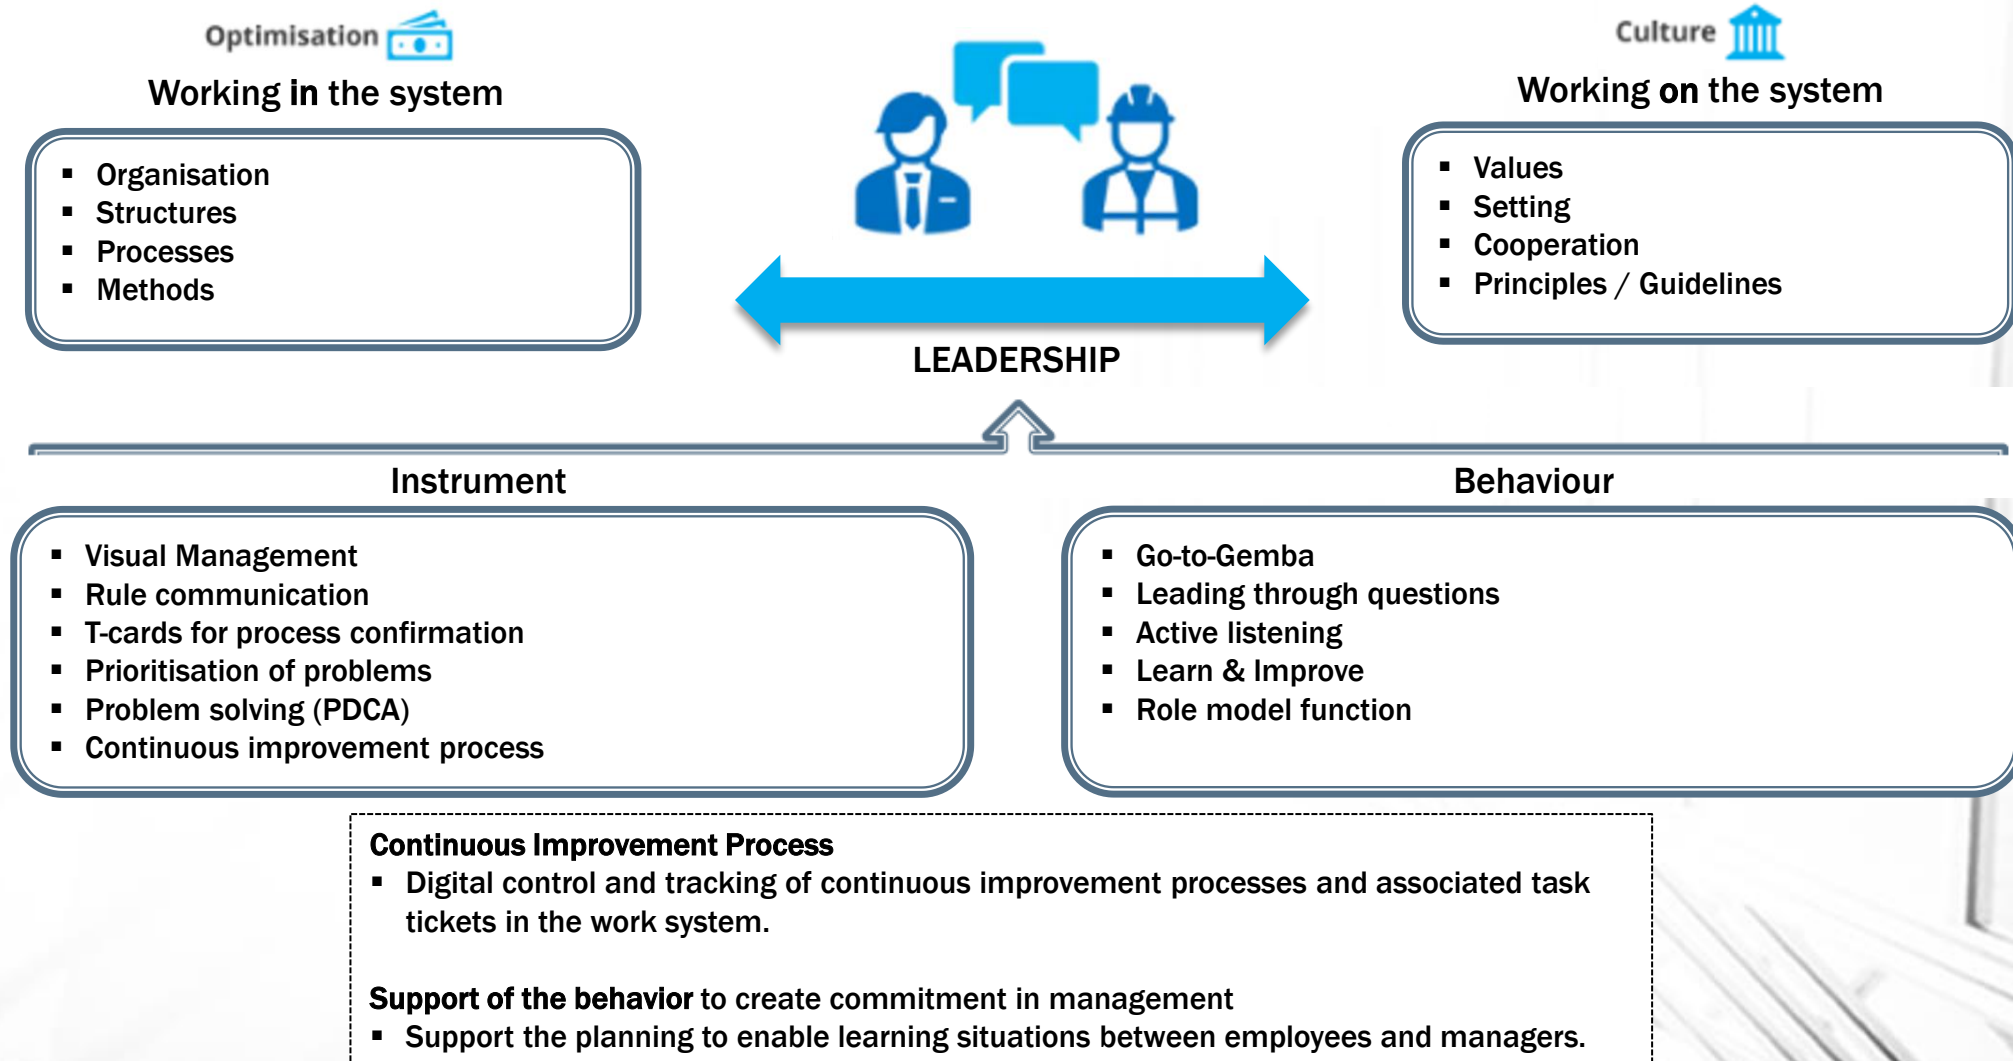

The Data security integrated system is focused on:

- ☐ Defence of the IIoT control devices
- ☐ Secure Remote Access
- ☐ Prevention of the spread of infection by network segmentation
- ☐ Protection of the critical equipment at the network level
- ☐ Prevention of the execution of malware and unauthorized programs
- ☐ Visualization of the asset information of production devices and security events

DIGITALIZATION RESULTS & CONTINUOUS IMPROVEMENT
