ASSEMBLY COMPONENTS

THE ADVANTAGES OF USING STERILE CONTAINER SYSTEMS

Sterilization containers are manufactured as an alternative to the packaging methods of each surgical instruments separately with sterilization rolls and the pouching method with the disposable sterilization wraps. However, the sterilization method with containers has various advantages with

Cost-Efficiency: It can be misperceived that disposable products are low cost and more economical, however, It is generally ignored the fact that these products should be disposed and becomes out of use. When long-term calculations are made, it ifound out that using containers are more economical for sterilization method. Additionallywraps used for pouching method can be deformed during the sterilization cycle or while carrying. This causes an improper sterilization cycle and the sterility of instruments cannot be ensured. This situation requires the instruments to be placed in the autoclaves for a new sterilization process again. Additional costs and loss of time can be prevented by using aluminium sterilization containers.

Eco-friendly: Disposable products contain paper and plastic materials. This causes piles of waste after every use. Environmental pollution caused by wastes of disposable products can be prevented by use of sterilization container systems.

Safety: Sterilization method with container systems is safer than the other methods. Sterilization containers can keep the instruments sterile during 6 months if the lid is never opened and the container is kept under the good and proper storage conditions.

Portability: The containers can be moved more easily and safely with the use of stainless steel handles and antibacterial and resistant to high temperatures silicone covering through the handles (optional for customers).

Identification: **Barcodes**, QR codes or Data matrix codes designated for instrument set names or any identification can be engraved on the coloured aluminium labels on the both sides of the container. Additionally, instrument sets can be separated and identified according to the different lid colour options.

STANDARD MODEL STERILIZATION CONTAINERS

STANDARD SERIES 1/2 HALF SIZE

Abraham Blacksmith
Better Solutions for Better Surgeons

**9 COLOUR
OPTIONS**

- Bottom Perforated and Bottom Non-Perforated Options are available for Standard Series of 1/2 Half Size.

- 9 Different colour options available.

- Single use paper filter, 100 cycles Textile filter and PTFE Filter options are available for Standard Series.

VALVE BARRIER MODEL STERILIZATION CONTAINERS

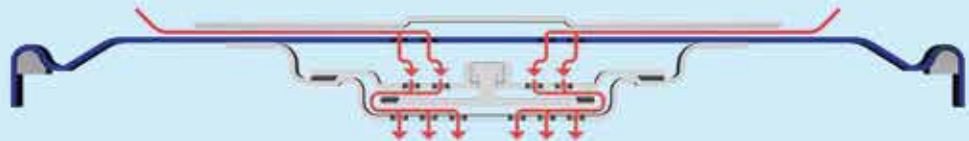

VALVE BARRIER MODEL STERILIZATION CONTAINERS

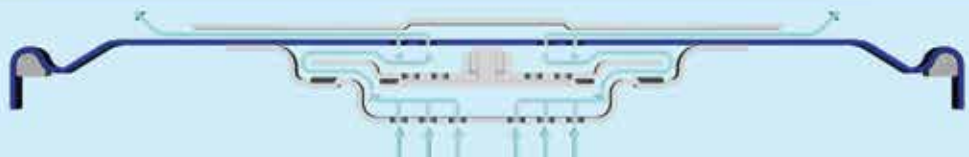

Valves are in the closed position before sterilization, as shown in the figure.

Valves are automatically opened by the steam pressure in the steam sterilizer and the sterilization cycle begins.

When the steam pressure in the steam sterilizer returns to normal, the valves are opened in the opposite direction and the container internal pressure and sterilizer pressure are equalized.

Valves become completely closed and air circulation is blocked after the sterilization cycle.

VALVE BARRIER MODEL 1/2 HALF SIZE

9 COLOUR
OPTIONS

- Valve Barrier series container are working without filter.

9 Different colour options available.
