

Managing complexity in Cities

with
Predictive Digital Twins
for
Liveable & Resilient Cities

Bart Vuijk TNO | 2024

TNO – Dutch Organization for Applied Research

- Established by law in 1932
- Not for profit, independent
- “Innovation for life”
- 75+ Professors & Lecturers
- Connecting Government, Academia and Business
- 5,000 professionals
- 600 million € revenue

Urban Challenges

Urbanisation | Aging population

Scarcity of space | Pollution

Infectious diseases | Decarbonisation

Reliable & affordable Energy

Traffic / Mobility / Accessibility

Legacy infrastructure / heritage

Inclusion | Crime

City: a complex organism

All things interconnected

Problem statement

Increasing complexity
of decision making

Silo's lead to costly,
sub-optimal solutions

Time
to decision

Quality
of decision

Infrastructure decisions: Billions of EUR

Vision: making complexity manageable

Interactive analysis of complex what-if scenario's with Digital Twins

Complexity

Entire City
in One View

Silo's

Cross-domain
Impact Assessment

Decision times

Interactive
Decision Making

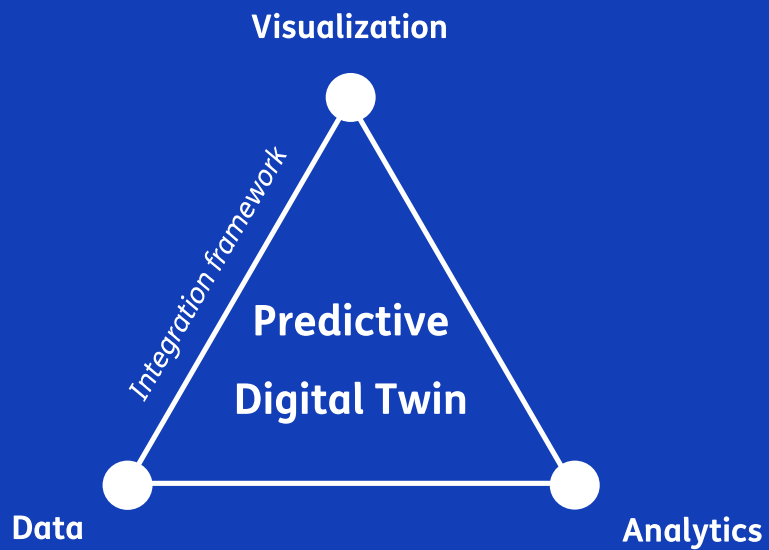

Quality

Balanced solutions
benefit well-being

Urban Strategy: making complexity manageable

Urban Strategy: making complexity manageable

TNO Urban Strategy – interactive Digital Twins

Multiple domains – interventions – perspectives

Urban Strategy simulation modules

Making Complexity Manageable – across multiple domains

Mobility Demand

Multi-mode network allocation

Active transport cycling & walking

Distribution of accessibility

Air quality (Road & Industry)

Noise (Road, Rail & Industry)

Electric fleet simulation

EV – power grid Interaction

Greenhouse gas emissions

Infrastructure Resilience

Spatial impacts

Well-being indicators

San Diego Digital Twin (2.5M residents)

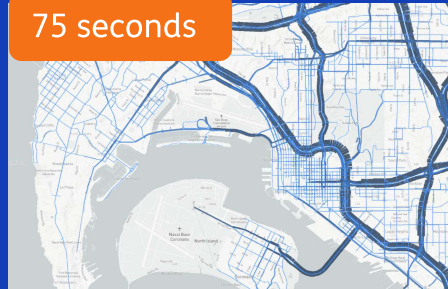

Calculation times of individual models

assignment**

19 seconds

Mode choice

0.7 seconds

Hub

40 seconds

Air

100 seconds

Noise

90 seconds

Traffic indicators

What do we do differently?

User oriented: **Interactive** and **Integral** for better decision making

Science based: Marriage of next level IT & domain expertise:

- **IT - High Performance Computing Technology**
 - Distributed computing & storage architecture
 - GPU based simulations – up to 1,000x faster
 - Extreme scaling potential
- **Multi-domain approach**
 - Traffic, Air Quality, Noise, Energy, Safety,
 - Parallelized algorithms for GPU infra

Modular by design – fully data driven

Seamlessly connected in one platform, tested in the real world

Traction

Amsterdam and TNO

- Innovation collaboration since 2017 (extended to 2026)
- TNO: responsible for innovations
 - Application of Digital Twin platform Urban Strategy
 - Model development
 - Support
- City of Amsterdam: innovative Use Cases
- Initiated by City of Amsterdam's CTO office
 - Adopted by strategic traffic planning office

How to plan large
renovation of
>100 km of quays
and bridges?

What is the
best location
for mobility
hubs?

How does
lowering the
speed limit
improve Air
Quality and
Safety?

What is the impact
of introducing
robotaxis?

What will be the impact
of large scale new
residential housing
on accessibility and
environment?

How do we
optimize the
impact of shared
vehicles?

How to improve
well-being &
inclusion for various
communities?

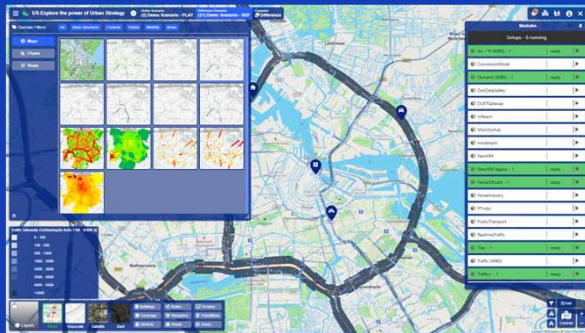

How will mega-events
affect accessibility of
the city?

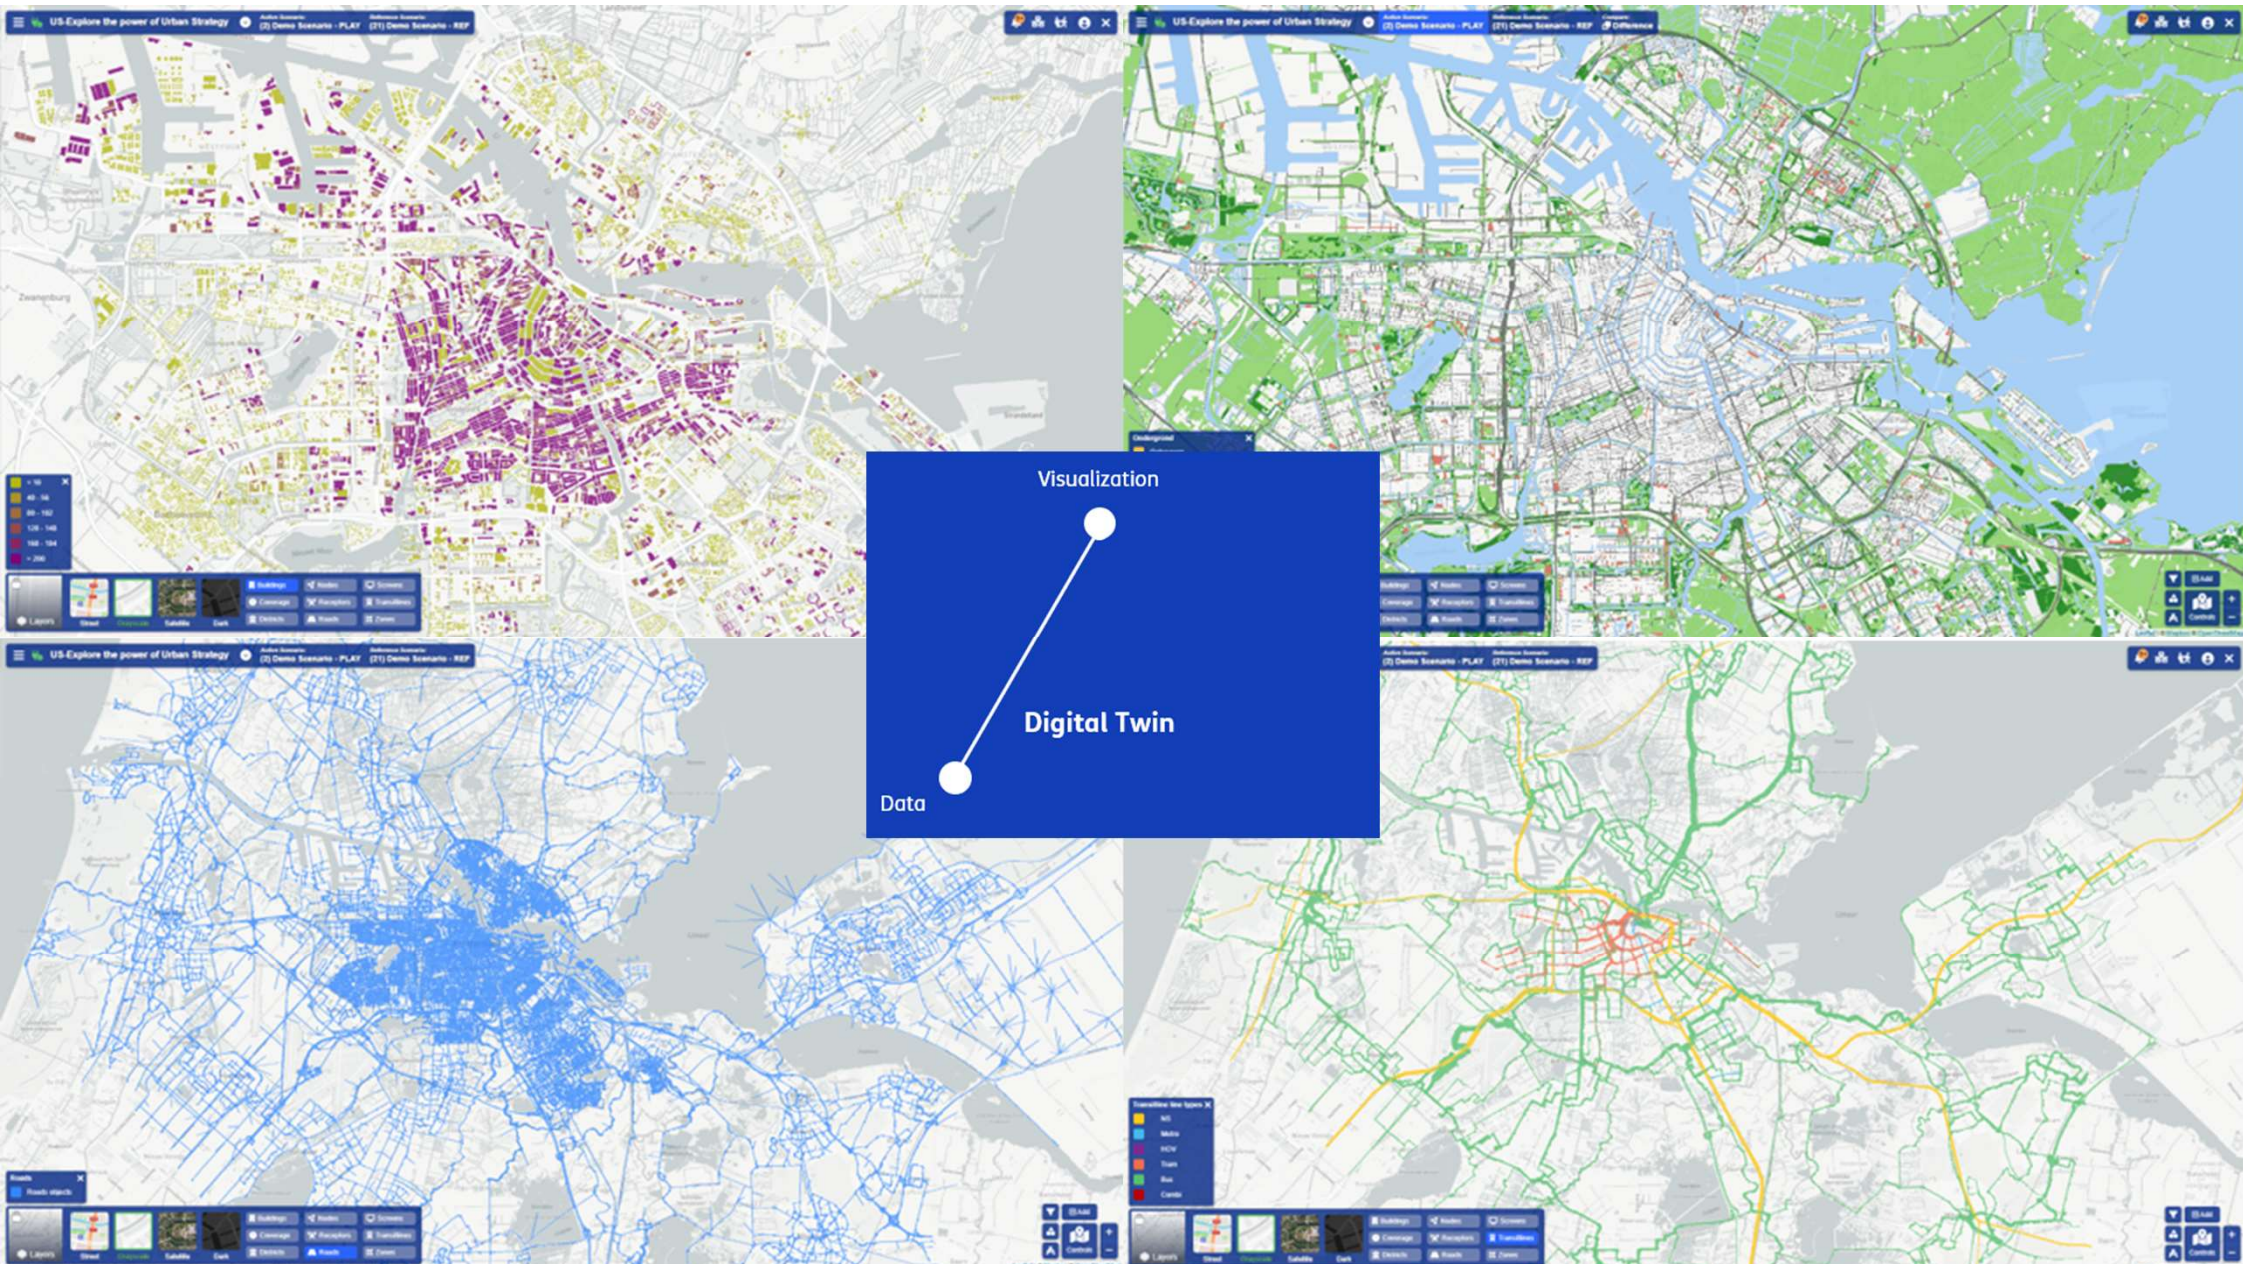

What will be the Air
Quality and CO2-
effects of a ZE
zone?

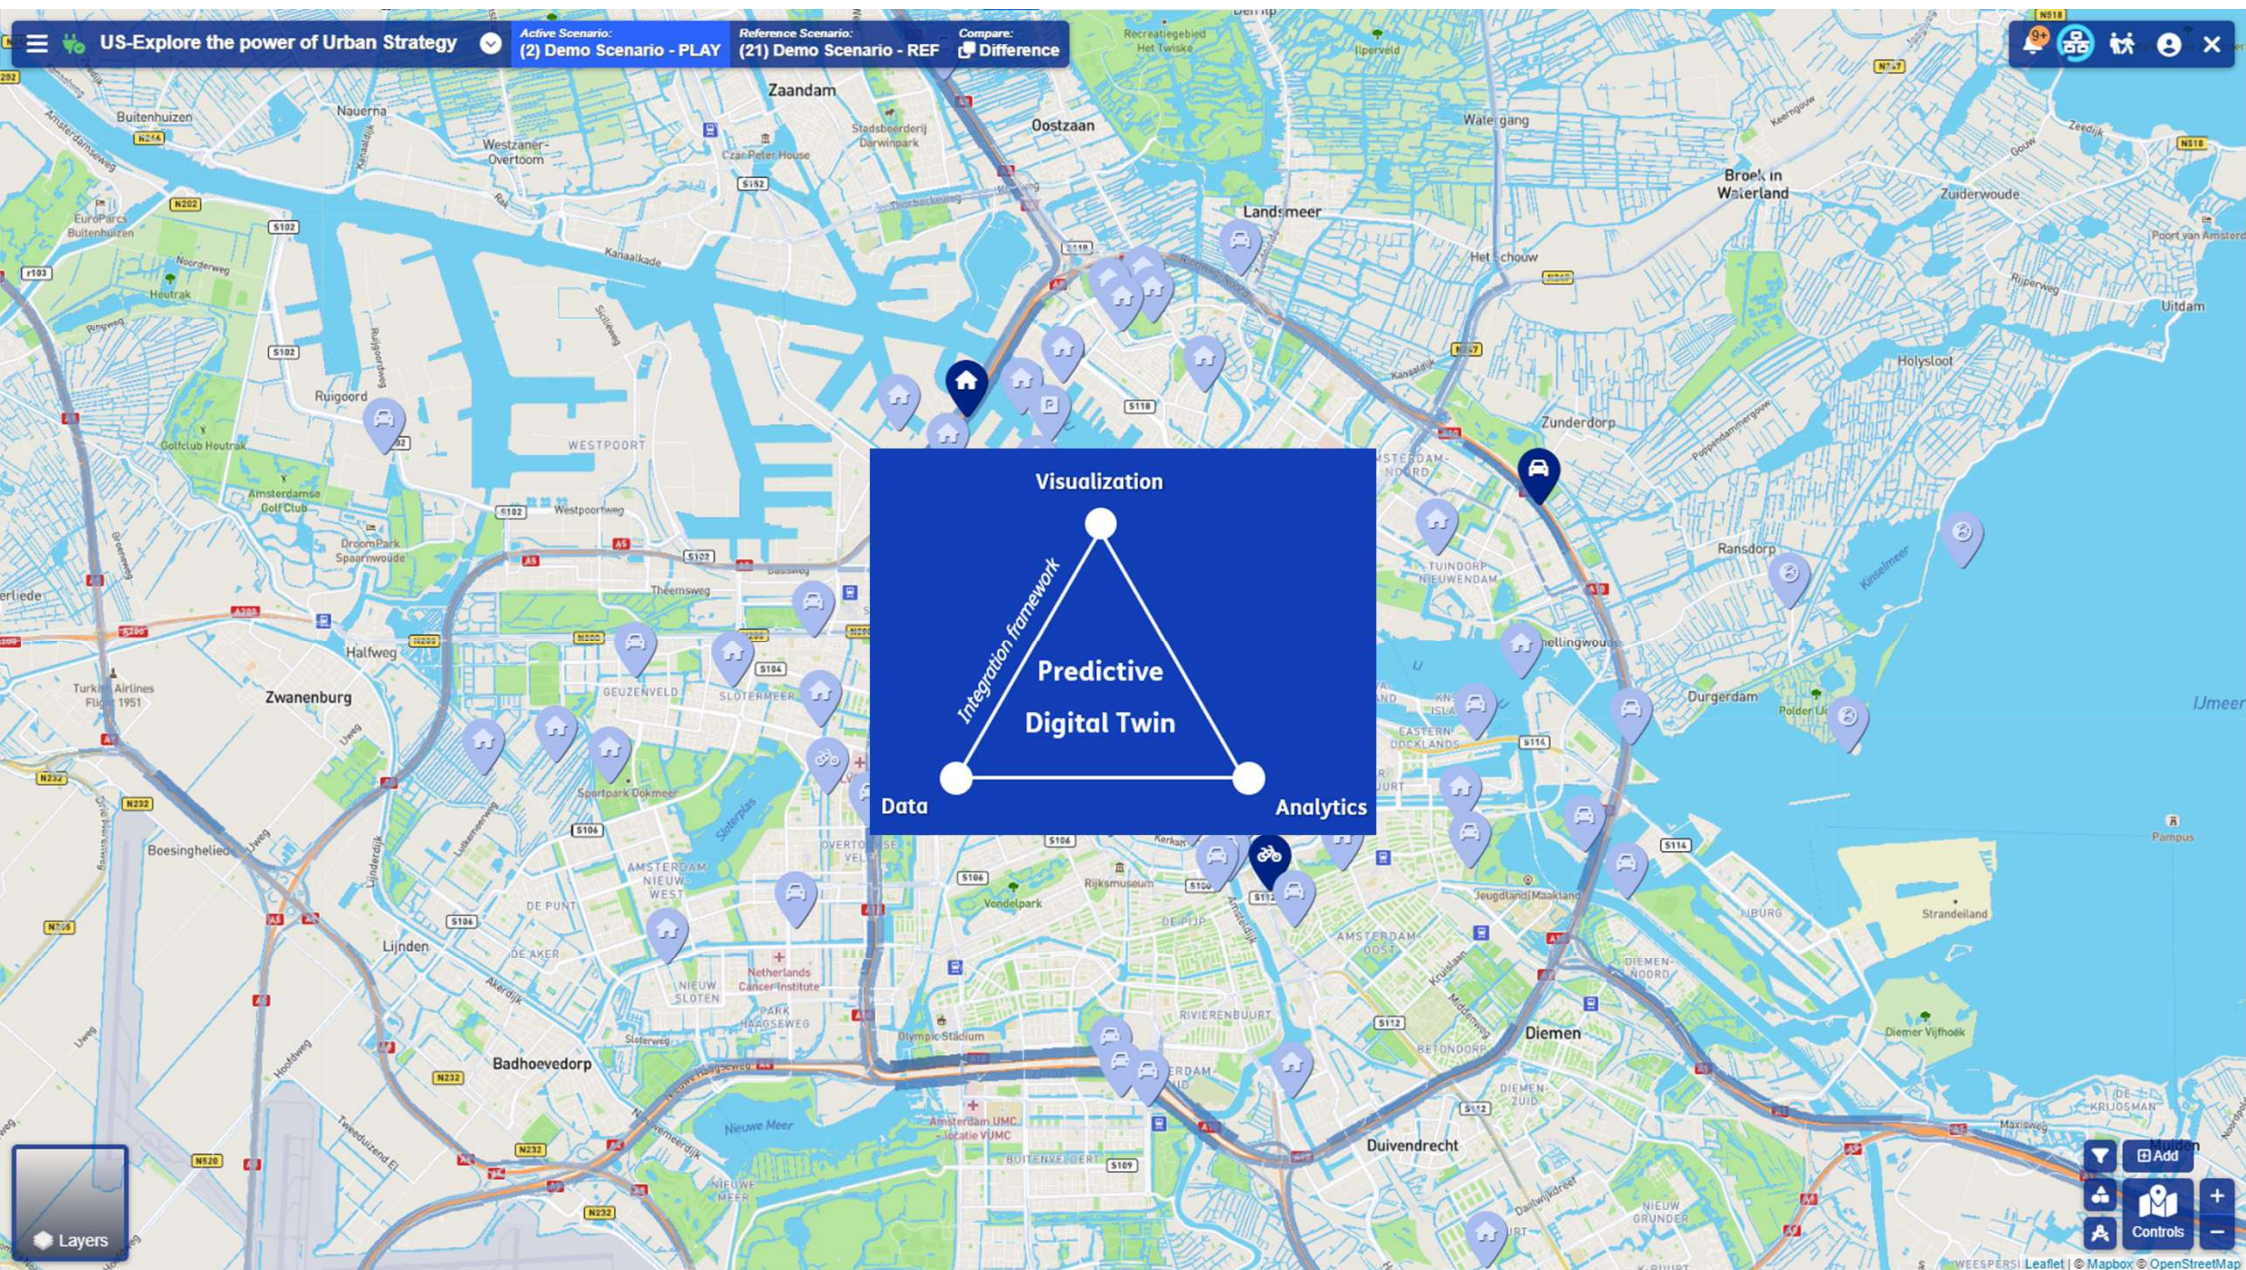

What is the
impact of
changing
parking tariffs
on use of Public
Transport and
Livability?

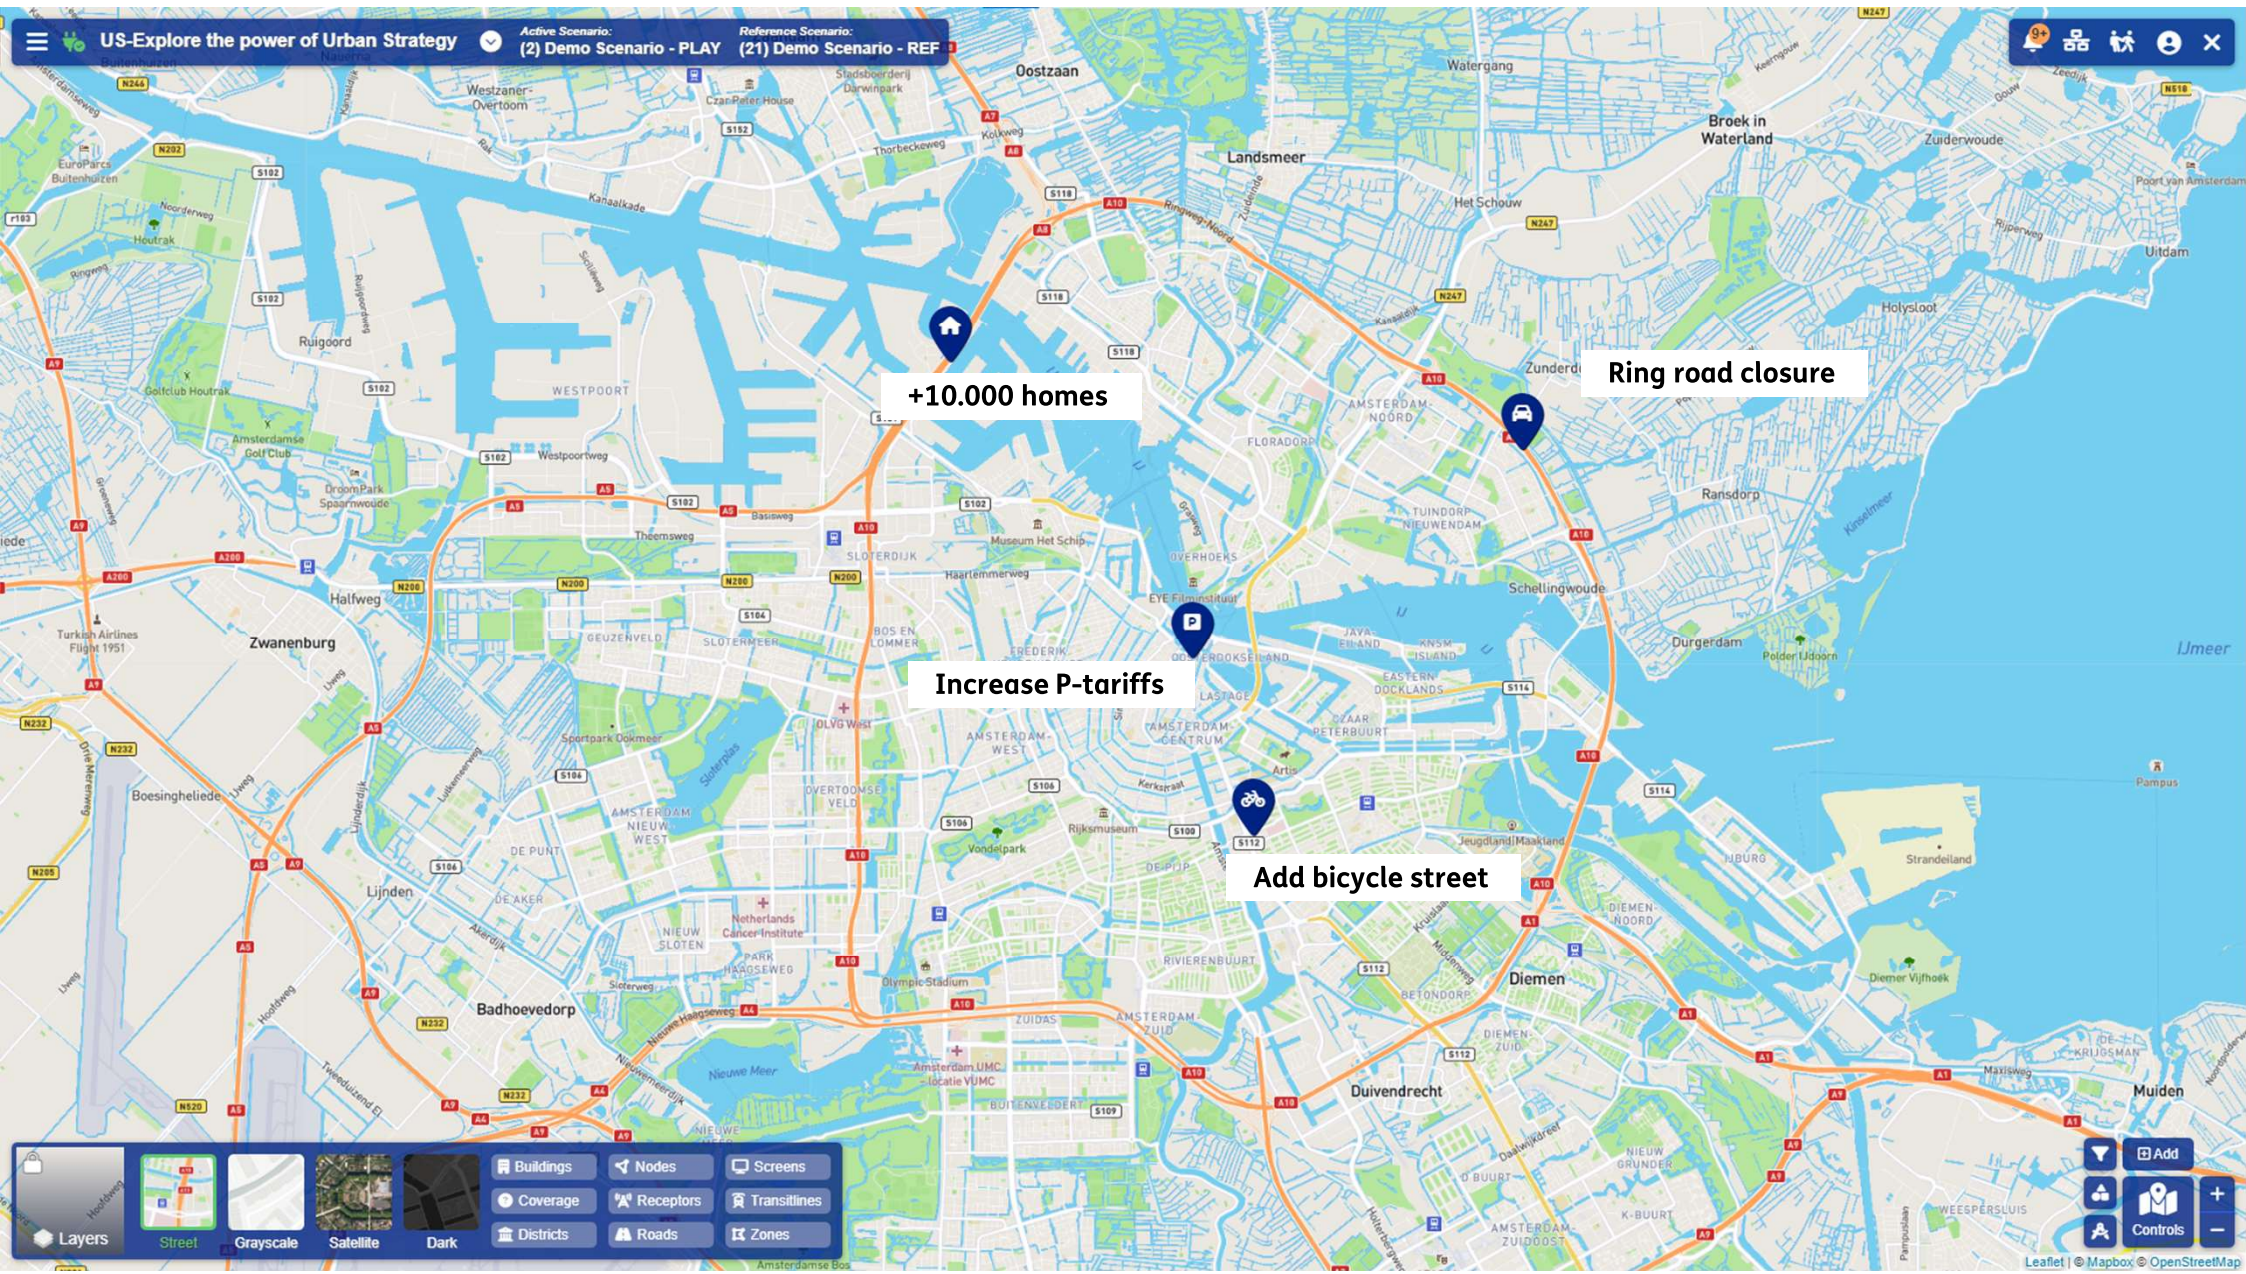

Amsterdam – Use Cases

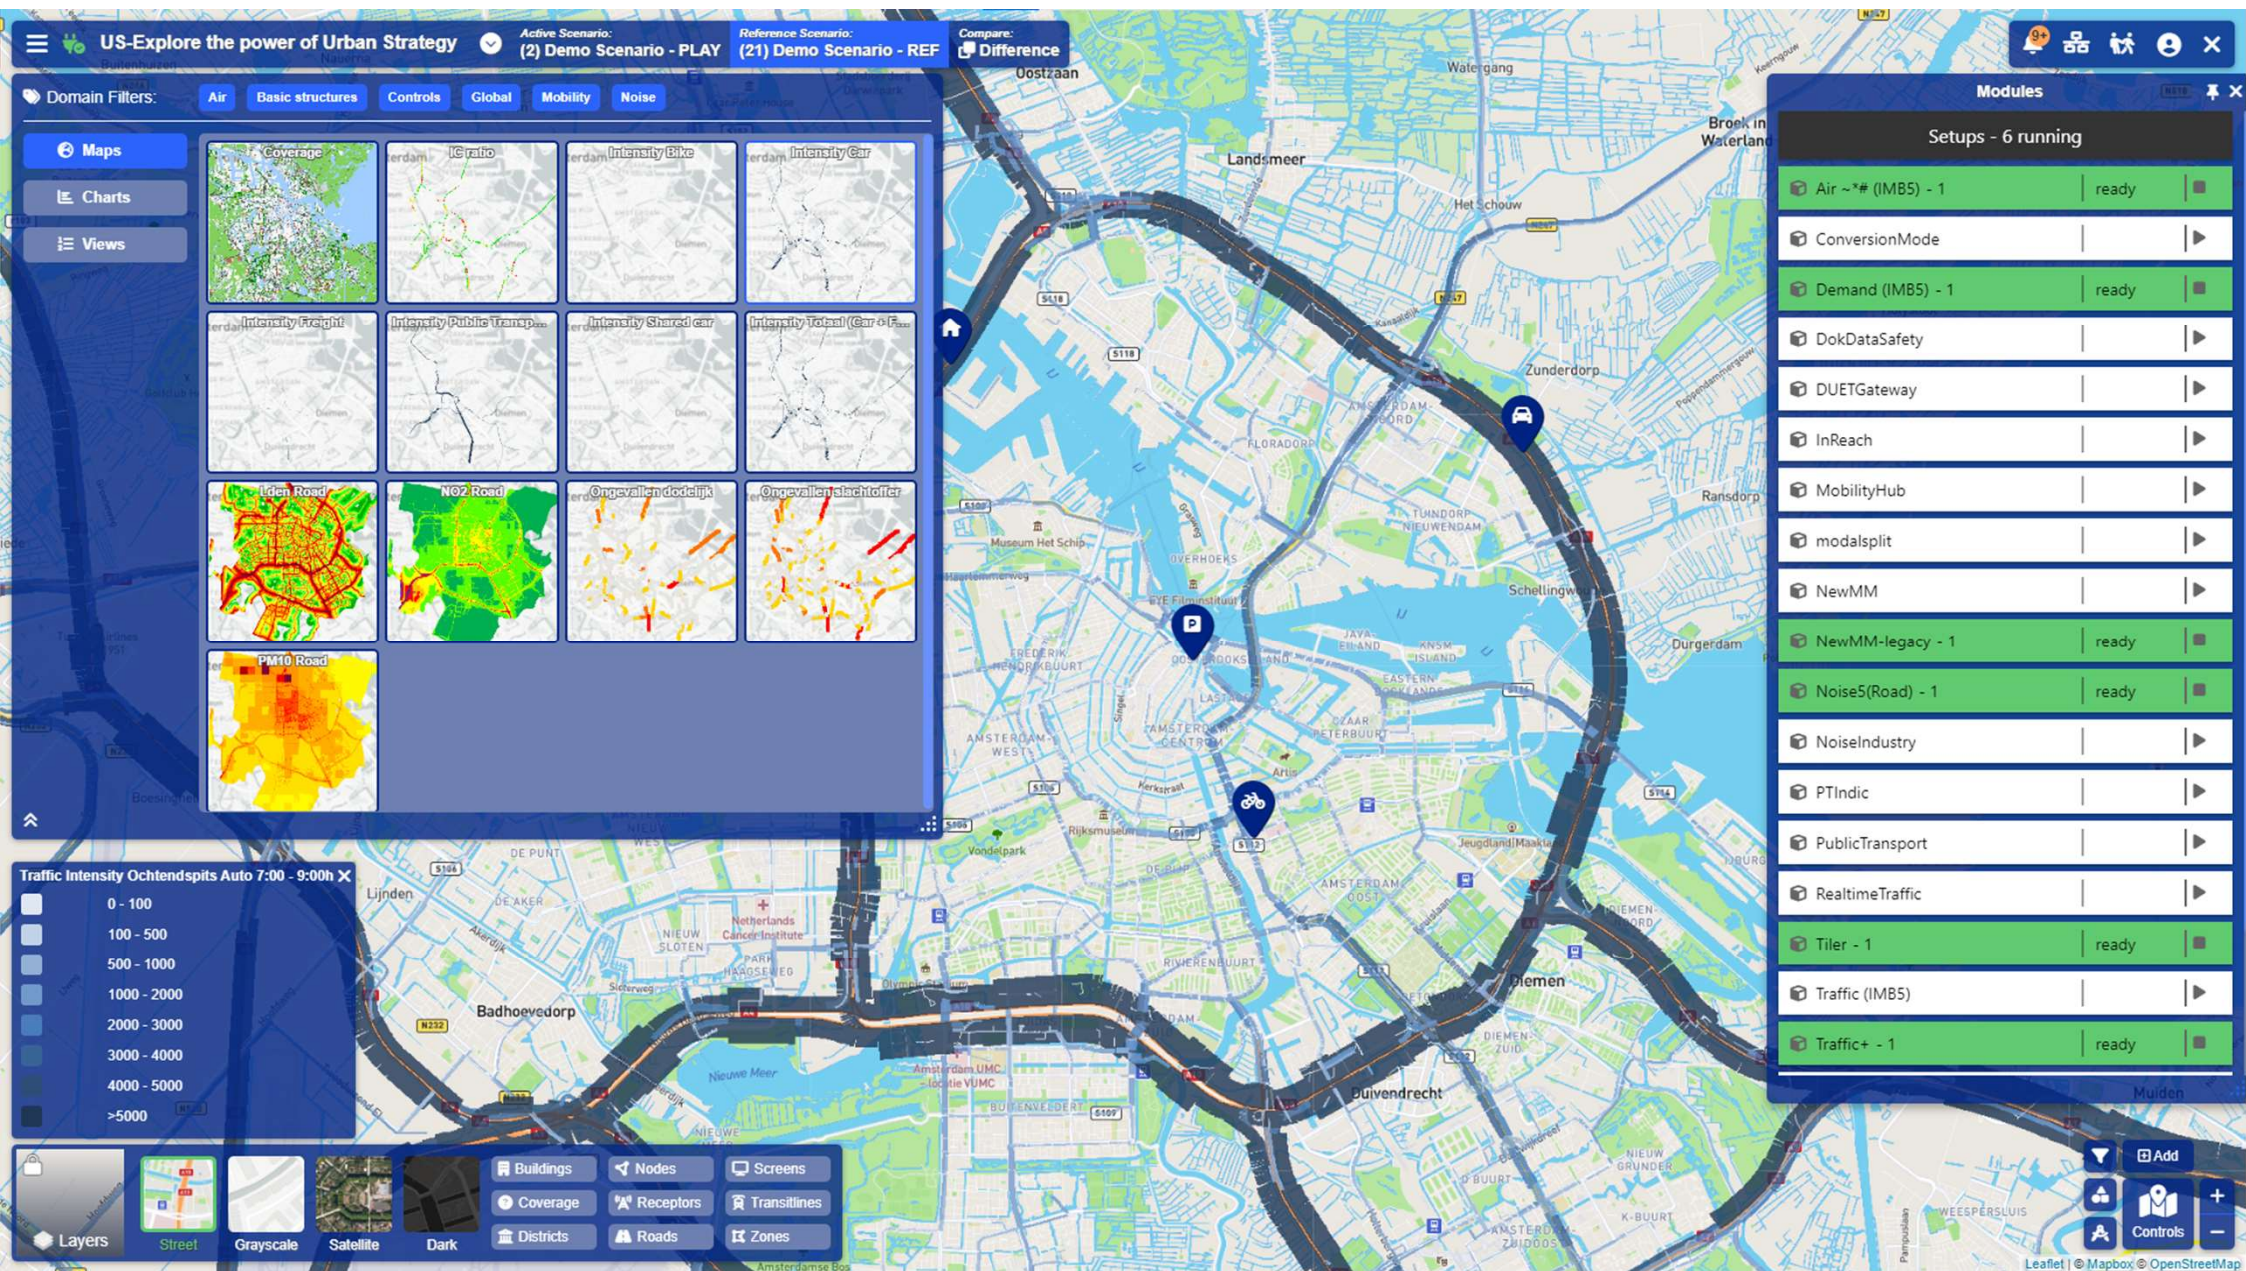

- › Integral Strategic Mobility Planning
- › Shared Mobility
- › Large scale infrastructure renovations
- › Environmental impact (NO_x, PM)
- › Parking policies
- › CO₂ impact
- › Equity use cases
- › Accessibility & transport poverty
- › Maximum speed reduction
- › City redevelopment
- › Events
- › Noise impact
- › Zero emission zones
- › Bus fleet electrification
- › AV introduction scenario's
- › Safety impact
- › Logistics (road, water)
- › Future mobility modes

Value of interactive multi-domain predictive Twins

| | Traditional | Urban Strategy |
|--------------------------|--------------------------------------|--|
| Decision Approach | Single domain | Integrated |
| Decision Process | 1 mobility scenario per day | >50 Mobility + Air + Noise + Energy scenarios/iterations per afternoon |
| Decision Times | Weeks to (many, many) months | Hours to days |
| Decision Options | Limited (often just “Y” or “N”) | Range of options |
| Decision Cost | Large inefficiencies through silo’s | Significantly reduced: One Instrument – One Language – One View for all stakeholders |
| Output | External paper report after 3 months | Immediate, self-generated, results in 2D/3D |
| Cost of Solutions | (Sub-)Optimized for 1 policy domain | Optimized across multiple domains |

Lessons learned in Amsterdam: practical value of science driven innovation in Digital Twins

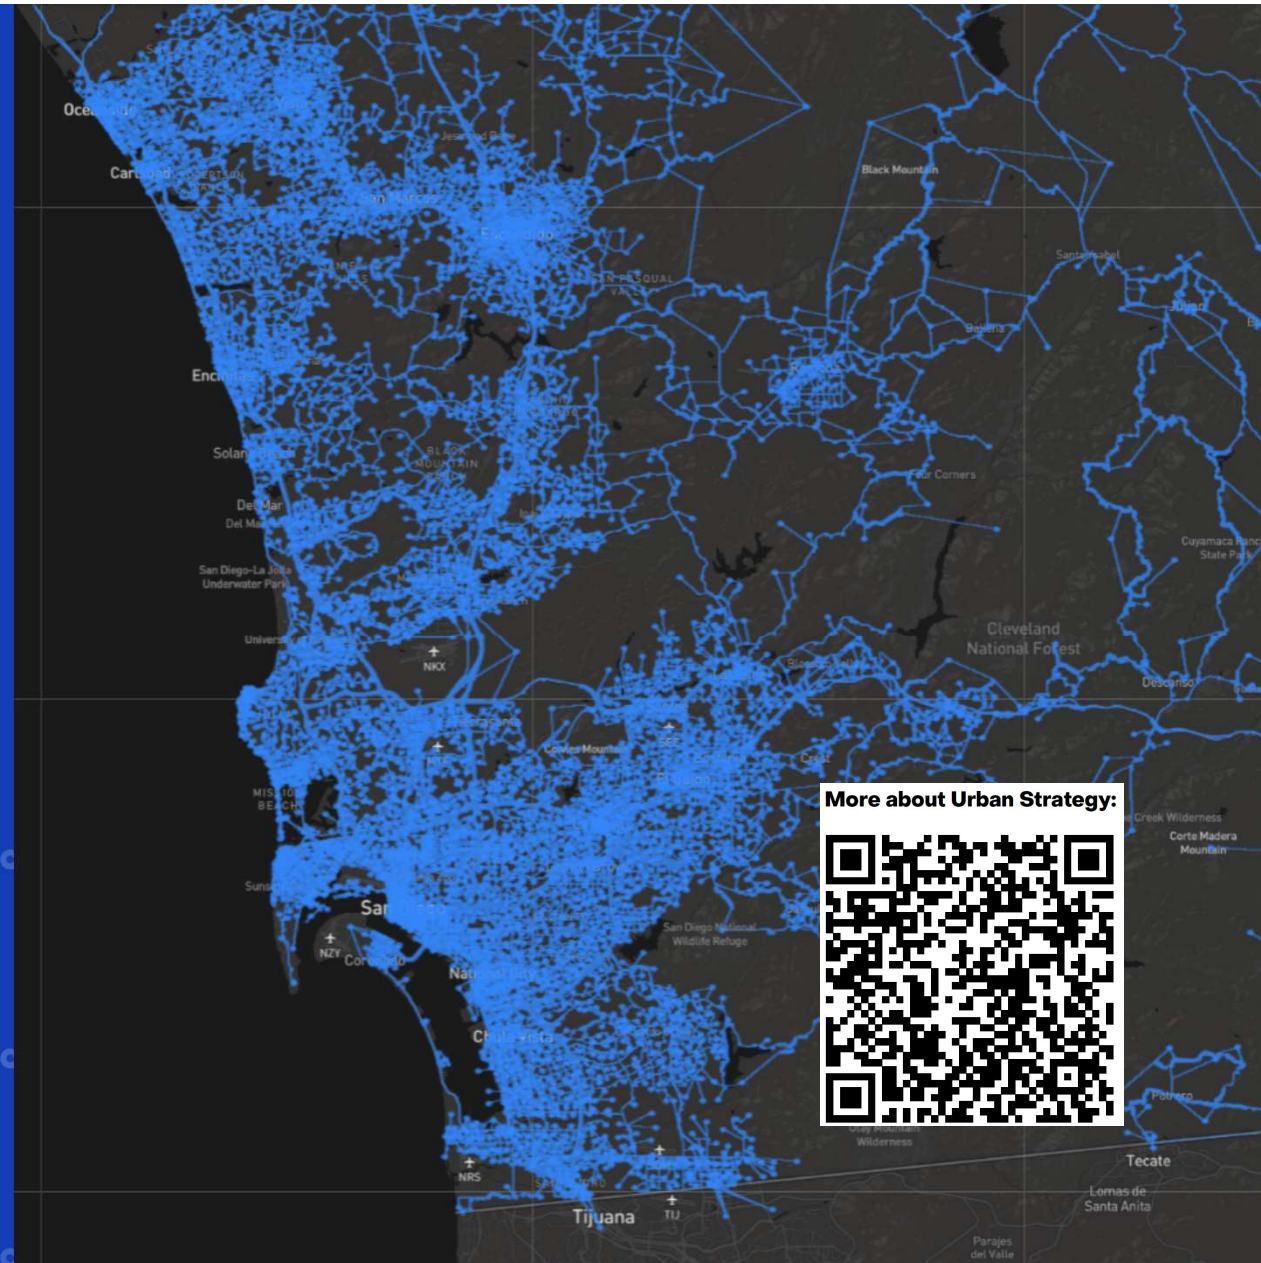

- Digital Twins are here to stay → from Innovation to Operation
- Digital Twins replace gut feeling by science based support
- Interactive decision making for cities is a game changer for decision makers
- Interactive Digital Twins increase the solution space for decision makers
- For the adoption of Digital Twins, it is key to find ambassadors in a city for this new way of decision support
 - Both on vision (CTO, innovation office, city leadership) and execution (domain specialists)
- A Multi-domain Digital Twin creates a common language and shared perspective that improves collaboration
- Digital Twins support people, they don't make decisions
 - Digital Twins support in assessing scenario's - People make decisions
- We ain't seen nothing yet !
 - Next step: AI assisted Digital Twins for optimized scenario planning

Urban Strategy Digital Twins for Sustainable and Liveable Cities

Kiitos!
