

ADVANTAGES:

- Always strict perpendicular direction of prongs to muscle fibers, allows proper, adequate and perfect muscle retraction, exploring clear surgical field.
- Eliminating undesired upward projection of shafts, handles or arms.
- Moving handles from wound end to the opposite one without removing and re-application.
- Could be used in smaller incisions comparing to single hinged arms types.

SPINAL RETRACTOR

Thoraco-Lumbar
Cervico-Thoracic
Limited Approaches

Limited Approaches

Prongs depth and width design make it more appropriate to apply in limited approaches posterior spinal surgeries, for example, Laminotomy, Fenestration, Hemi / Laminectomy... etc, in single / limited levels utilizing small skin incision and short segment muscle retraction.
