

Threat Intelligence Platform

Turning Cyber Risk into Strategic Insight

Key Benefits of IKARUS TIP

- **Comprehensive, high-quality intelligence** from global and local sources, structured at strategic, operational, and tactical levels.
- **Accelerated, informed decision-making** through actionable insights into active incidents, attacker methodologies, and threat campaigns worldwide.
- **Proactive risk management and defense** enabled by targeted investigations, threat mapping, and strategic situational awareness.
- **Flexible, vendor-agnostic integration** tailored to your infrastructure, compatible with SIEM, EDR, NIDS, firewalls, proxies, sandboxes, and other cybersecurity technologies.

Executive Overview

The IKARUS Threat Intelligence Platform (TIP) provides executive leadership and security teams with access to comprehensive and high-quality collections of structured, contextualized cyber threat intelligence.

It transforms fragmented threat data into actionable insight — enabling faster decision-making, stronger defense posture, and improved resilience against evolving cyber risks — independent of any specific security vendor or technology.

From Data to Decision-Ready Intelligence

Traditional security technologies rely on isolated, product-specific indicators with limited context. The IKARUS TIP elevates this data into evidence-based intelligence by integrating technical indicators with adversary context, methodologies, infrastructure analysis, and global research.

The result is decision-ready intelligence that supports:

- Enterprise risk management
- Incident response and breach assessment
- Targeted threat hunting
- Strategic threat landscape analysis
- Regulatory and governance accountability

■ Structured Intelligence Across All Levels

All intelligence within the IKARUS TIP is organized across three decision layers to support both operational teams and executive leadership:

Strategic Intelligence

Provides macro-level visibility into threat trends, targeted industries and regions, adversary motivations, and potential geopolitical or criminal sponsorship. Enables informed board-level risk discussions and long-term security planning.

Operational Intelligence

Adds contextual depth around attacker tactics, techniques, and procedures (TTPs), enabling attribution, campaign tracking, and alignment of incidents with known threat actors.

Tactical Intelligence

Delivers technically enriched Indicators of Compromise (IOCs) – including domains, IP addresses, malware families, campaigns, and toolsets – allowing rapid validation, prioritization, and response at the security operations level.

■ Unique Data Quality and Source Integration

The IKARUS TIP combines:

- Curated open-source intelligence
- Leading commercial intelligence feeds
- Proprietary intelligence collected via IKARUS sensors
- Vulnerability intelligence and technical signatures
- Campaign, malware, and attacker attribution data
- Customer sources and tech-stack integrations

All sources are normalized, structured, correlated, and continuously quality-assured to ensure reliability and relevance.

■ Flexible and Secure Integration

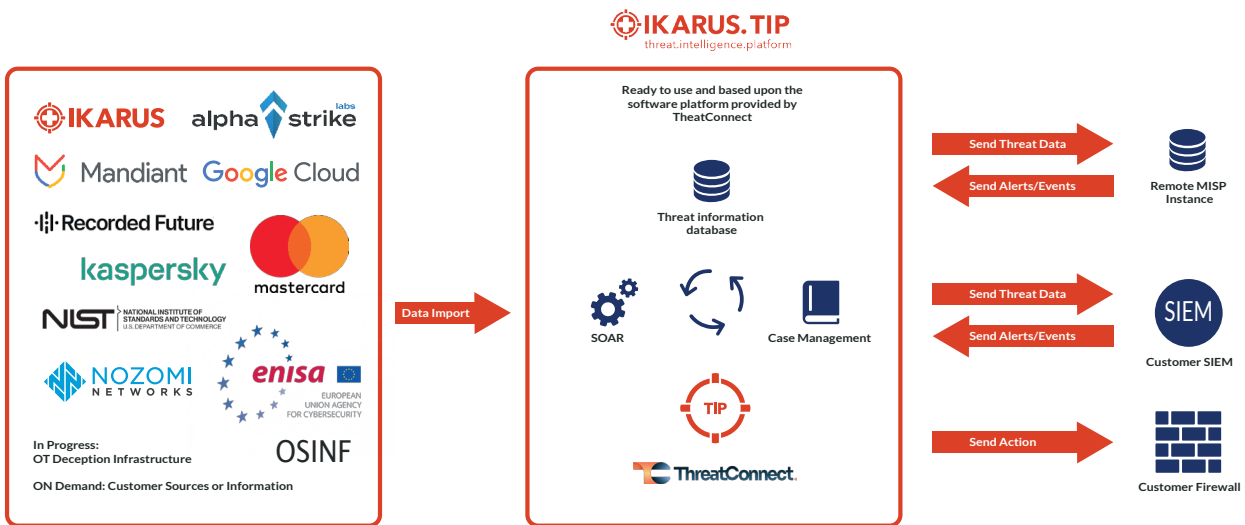

The platform integrates seamlessly into diverse enterprise environments:

- Cloud-based deployment
- On-premises installation
- Support for air-gapped environments

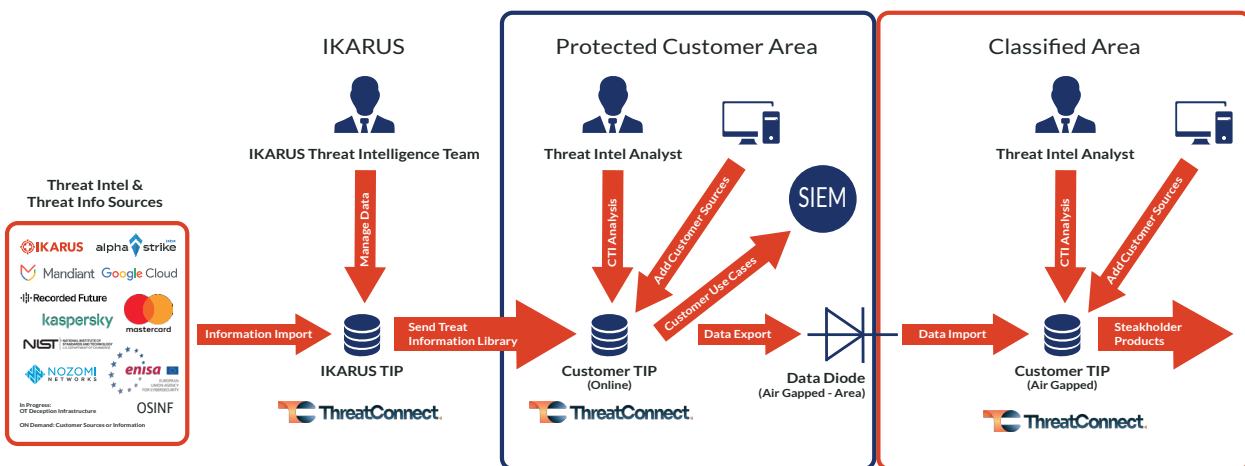

Intelligence can be accessed directly through the platform for targeted investigations or integrated into existing SIEM, EDR, NIDS, and other security technologies via structured data feeds.

- IKARUS TIP enables organizations to move beyond reactive defense – providing leadership with the clarity, context, and confidence required to manage cyber risk strategically.

About IKARUS

IKARUS Security Software has been developing and operating leading cyber security solutions since 1986. The company's own developments focus on the renowned IKARUS Malware Scan Engine, efficient cloud solutions and the protection of critical infrastructures. Together with selected technology partners, IKARUS offers additional security services for companies of all sizes and industries as well as for critical infrastructures. These range from the modular IKARUS Threat Intelligence Platform with local and international CTI, through Incident Response Services and advanced Threat Protection, to the integration of innovative OT security sensors.
