

Digital Justice

Net Group from Estonia helps governments develop the rule of law, achieve efficiency in courts, gain transparency in legal processes, increase citizen satisfaction, and improve the country's business environment.

Digital justice can be defined as the use of technology, information, and communication to improve citizens' access to justice and ensure effective judicial action.

Digital justice principles

The digital justice process is generally a holistic and integrated solution composed of various components.

These components can be implemented separately.

However, the Once-Only Principle should always be taken into consideration – once data is entered into the system, it should be available for use in other phases of the process.
