

Launch4: Connect systems. Prove impact. Scale what works.

What we do

We build sector-agnostic, deployable data infrastructure that connects fragmented inputs and turns them into evidence-backed workflows for traceability, governance, and decision-making.

Why this exists

Industries don't struggle because they lack data. They struggle because workflows break when data is fragmented across tools and partners. Launch4's approach is oriented towards what the industry needs:

- **Modular:** Reuse the same modules across sites, products and partners
- **Impact:** Validate one workflow end-to-end fast, measure outcomes, then scale what works.
- **Multi-party:** Designed for ecosystems: buyers, suppliers, operators, and multiple systems.

If you can't trace it, you can't manage it.

Start with an assessment, then pilot and finally scale.

Which outputs do Launch4 deliver?

- **DPP & product traceability:** From scattered supplier inputs to shareable product profiles.
- **Supplier evidence & verification:** Standardise evidence and keep a clear source-to-output trail.
- **Multi-party integration & governance:** Connect ERP/PLM/MES + partners with versioning and approvals.
- **Operational analytics for decisions:** From monitoring to action: quantify drivers and outcomes after change.

Our current solutions

HydraDPP

DPP & product traceability workflows for supplier data and materials.

Metis

Multi-party Scope 3 intelligence network for carbon emissions.

Almena

Operational analytics for energy assets and insights on renewable energies.

- 
- **Direct deployment**
 - **Co-delivery with partners**
 - **White-label modules**

For enterprises, integrators and investors.
