Buildometric

Clear data, real impact
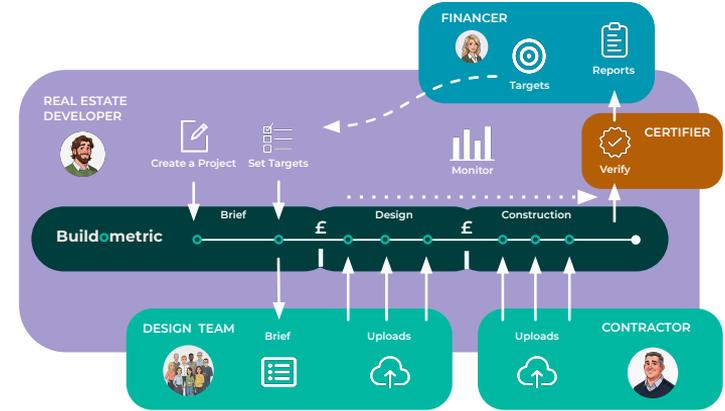

Open Call for Project Partnerships

Buildometric is working with industry frontrunners who are leading the way, making the UK's most sustainable buildings. We are a software platform that helps set, monitor and maintain an auditable trail of building metrics during design and construction.

Our software allows you to easily collect, store and export evidence for finance, planning and certification, making it quicker and easier to find the information you need and to stay on top of targets.

We're looking for more of these ambitious developers to test our platform in free of charge pilot projects. This is an opportunity, to gain real efficiency, insights, and shape a tool around *your* workflow.

Design-to-Delivery Continuity

Buildometric creates an auditable record of performance from design intent to as-built evidence. Protect your sustainability claims, satisfy financiers and assessors, and help occupiers operate the building as intended.

Productivity Gains

Stop chasing information. Designers and contractors upload evidence to one shared space. Project managers can easily review in real time with mismatches automatically flagged to keep projects on track.

Enhance Values

Demonstrate value to funders and stakeholders, and avoid cost overruns with built-in guidance that reduces risk. Be ready for emerging monetisation opportunities such as stored carbon and material values.
