

Converting energy-intensive operations into dynamic, cost-optimized processes

fEnOMS™ autonomously controls energy generation and consumption based on electricity prices – reducing electricity costs and CO₂ emissions.

fEnOMS™ orchestrates optimized energy flows across all sectors.

From thermal generation (cooling & heating) to PV, energy storage and EV charging: fEnOMS™ connects and controls all key energy assets through a centralized, data-driven platform – enabling intelligent, flexible, and future-ready operations.

Control energy. Unlock flexibility.

With flexality's AI-powered platform fEnOMS™, you turn existing infrastructure into a flexible energy system – cutting electricity costs, reducing CO₂ emissions, and getting ready for the energy transition.

- ▶ **fEnOMS™** synchronizes your entire energy infrastructure – from cooling and heating to solar generation, storage systems, and EV charging. The cloud-based platform provides real-time insights and transforms energy market signals, weather forecasts, and asset data into optimized, fully automated operating schedules.
- ▶ **flexcool™** is our dedicated module for refrigeration processes – particularly in cold storage facilities – supplying operational parameters, demand forecasts, and defrosting data directly into the fEnOMS™ system.
- ▶ **flexheat™** unlocks the flexibility of industrial heat. It connects high-energy thermal assets – like heat pumps, steam and electric boilers – to enable smart, price-responsive and future-proof operation.

Reduce Electricity Costs

Lower your energy costs by shifting high-load processes into low-tariff hours – powered exclusively by data. No hardware upgrades required.

Cut CO₂ Emissions

Integrating more renewable energy into your operations cuts CO₂ emissions – and clearly demonstrates measurable progress toward your sustainability goals.

Boost Competitive Advantage

In the energy transition, flexibility is no longer optional. With our solution, you lead the way – combining cost efficiency with climate action.
