

ONE SYSTEM TO SAVE LIVES

Three Danish companies – °MEQU, Eldon Biologicals, and AP Services – have joined forces to deliver life-saving solutions to Ukrainian combat medics operating under extreme conditions.

Their combined technologies and expertise are empowering medics to perform rapid, effective interventions that save lives on the battlefield.

Eldon Biologicals manufactures the ELDONCARD® rapid blood typing test that enables fast, reliable blood typing in the field – critical for safe blood transfusions.

PULSE of Ukraine

Ukrainian NGO PULSE of Ukraine develops tactical medicine in Ukraine, with more than 20,000 servicemen trained.

During the full-scale invasion, PULSE has trained and equipped several brigades in pre-hospital blood transfusions, providing Ukrainian combat medics with life-saving knowledge and tools.

As all of PULSE's activities are funded through donations, they deliver valuable training and equipment at no cost to the Ukrainian Armed Forces, which we support.

The Walking Blood Bank Ukraine

The Walking Blood Bank Ukraine is designed to generate donor blood for both civilian and military casualties and to provide the Ukrainian Armed Forces with life-saving equipment. This equipment includes ELDONCARD®s for blood type determination, °MEQU blood warmers, and complete transfusion kits from AP Services. Deliveries will be accompanied by targeted training for military medics, ensuring they can use the equipment to save lives and prevent unnecessary amputations.

With a different set of partners (DonorUA and the Yashchenko Foundation), Eldon Biologicals has launched the Walking Blood Bank Blood Donor Mobilization, offering free blood type testing in exchange for blood donor registration. The project aims to recruit 2 million new blood donors, ensuring that voluntary donations can meet needs across the country and generate sustainable results that will benefit the nation even after hostilities have ended.
