

Your system still works. It just can't keep up.

The system still runs. It just can't keep up with where the business needs to go.

DOES THIS SOUND LIKE YOU?

Your revenue is up, the team is bigger, and the roadmap is fuller than ever. But somehow, every feature still takes months to ship, and every new client integration turns into a project of its own. You've raised it with your CTO. The explanation makes sense, the system has limits, it wasn't designed for this scale, but that doesn't make it easier when sales is waiting, or when you're watching a competitor move faster with half the headcount. You're not looking for a miracle. You just want to know what it would actually take to fix it, and whether it's worth it.

SOUND FAMILIAR?

"We'll get to it next sprint"
Except next sprint has been the answer for eight months.

"It's a quick change"
Your CTO said three weeks ago. It's still in progress.

"We almost closed that one"
They walked when you quoted the integration timeline.

"The board wants to understand the roadmap delays"
And you're running out of ways to explain it.

How we help you break through.

- 1 Clarity on what you're dealing with | 2 weeks**

Before anything else, you need to know what's actually going on inside the system. We go through every component, dependencies, integrations, data flows, deployment setup, and come back with a clear picture of where the bottlenecks are, what's safe to change first, and what carries the most risk. You leave with something concrete: a written report you can act on, share with your board, or simply use to finally answer the question your CTO has been hedging around.
- 2 Phased modernization | months 1-4**

We break the work into small, shippable increments. No big-bang rewrites that freeze your business for 6 months. Each phase delivers a working, tested piece of the new system while the old one keeps running. Your team sees progress every two weeks, and so does your board.
- 3 Modular, API-first delivery | months 4-6**

Clean, documented codebase. Automated tests. CI/CD in place. But more importantly, features that used to take 4 months now take 3 weeks. New client integrations go live in days, not quarters. Your engineers spend their time building, and your sales team stops losing deals over your tech stack.

Ready to talk through it?

Most teams we talk to already know something is wrong. What they don't have is a clear picture of what fixing it would actually involve, how long, how much, and where to start without breaking what's already running. That's what the first conversation is for. No commitment, no proposal. Just an honest look at your situation.

WHO WE ARE

We are a Berlin-based software engineering company with 100+ engineers and 15 years of experience delivering complex projects for mid-market companies across the Netherlands, the UK, Scandinavia and beyond. Our engineering teams operate across Serbia, Bosnia & Herzegovina, and Portugal. We've spent 15 years working in the kinds of systems that need modernization. We know exactly how they break, and how to fix them. We offer both managed modernization projects and dedicated engineering teams, depending on what works best for your organization.
