	Which of the following is the main disadvantage of plane table surveying?
Ans	X 1. The plane table survey is generally more rapid and less costlier than most other types of surveys.

√ 2. The method requires large amount of time to be spent in the field. Only relevant details are located because the map is drawn as the survey progresses. Irrelevant details get omitted in the field itself. As the instruments used are simple, not much skill for operation of instruments is required. This method of survey requires no field book. Q.41 The process in which glass is subjected to heating and slow cooling is: Ans X 1. Cracking ✓ 2. Annealing X 3. Casting X 4. Pastursation Q.42 Which of the following is NOT an accelerator in making concrete? Ans X 1. Formaldehyde √ 2. Ammonia X 3. Sodium Chloride X 4. Calcium Chloride Q.43 Which of the following is NOT a physical property of materials? √ 1. Abrasion X 2. Swelling X 3. Water absorption X 4. Bulk density Q.44 Irrigation frequency depends upon: Ans X 1. soil, crop and fertiliser X 2. soil, crop but not climate X 4. soil and crop only Q.45 According to Mohs scale of hardness, the mineral with the least hardness is: Ans X 1. Read the following passage and answer the questions below it.

How large do you think toads are? Even the largest toads probably were not as big as the cane toad. This toad, native to South America and the Caribbean, can weigh as much as four pounds! In 1935, sugar cane farmers in Australia were having a problem with two types of beetles that were destroying their crops. About one hundred cane toads were shipped to Australia from Hawaii. People hoped the toads would be a solution to the problem. Unfortunately, things turned out very differently than they had anticipated. The cane toads quickly became a more annoying pest than the beetles had ever been.

There are several things that make the cane toad so unusual. First of all, the cane toad has almost no natural predators. If the cane toad feels threatened, it will secrete a poisonous liquid. This liquid can kill children and small animals. It can even blind an adult for several hours. The cane toad is also poisonous in all stages of its life. Fish normally feed on the eggs of frogs and toads, but even the eggs of the cane toad are poisonous. Each pair of cane toads can produce more than 30,000 eggs each season. Because many of the eggs and tadpoles are able to mature, the cane toad population can grow very rapidly.

This is exactly what happened in Australia. Without any predators, there were suddenly thousands of cane toads in the Queensland area. People might have been more tolerant if the animals had been successful in getting rid of the sugar cane beetles. It turned out, however, that the cane toads did not have any effect on the beetles, which could easily fly out of harm's way.

The Australians are not quite sure how to get rid of cane toads. In fact, they continue to spread across the continent. Cane toads eat many types of Australian wildlife. They can also be dangerous to pets and children. Even so, not everyone in Australia hopes that the plans to rid the country of these animals will be successful. Some people even leave food in their backyards or adopt the giant toads as pets!
