

# COMPACT VGCK

For MS-Y/Z1000 PC Case

Very often, large graphics cards also fit into small PC cases. What doesn't fit into them, however, are the large kits for the vertical installation of graphics cards. That is why Sharkoon has introduced the Compact Vertical Graphics Card Kit. The kit avoids any drooping of the card, while the card's RGB illumination can be shown to its full. At the same time, it also makes a GPU cooler with RGB illuminated elements more visible in a water-cooled case.

## *Quick Installation*

The Compact VGCK is easy to install in the PC case: The bracket can be attached to the mainboard tray in just a few simple steps. The riser cable is then connected to the mainboard and finally to the graphics card.

## *Show Me What You Have!*

With the Compact VGCK, graphics cards that have impressive RGB illumination get what they deserve: Thanks to a lateral positioning, the card and its RGB elements will be more clearly viewed behind the glass side panel of the case, combining with the other hardware components to create an awesome show of light.
