

Acknowledgements

This volume, which includes rapporteurs' reports of the working groups and manuscripts from many of the workshop participants, is based on a SCOPE metals cycling workshop held in Toronto in September 1984. Our need to better understand the pathways and cycles of the elements arsenic, cadmium, lead and mercury and to help focus international scientific studies on these important potential toxic elements were key factors in SCOPE's decision to form a metals sub-committee.

This report forms a part of the activities of the SCOPE sub-committee on metals cycling, which is a sub-committee of the overall SCOPE Biogeochemical Cycling Committee, chaired by Professor Thomas Rosswall of Linköping, Sweden. Help in the planning of the Toronto Workshop which forms the basis of this report was received from the sub-committee members E.D. Goldberg (USA), J. O. Nriagu (Canada), P. J. Peterson (UK), P. Buat-Ménard (France), V. Subramanian (India), G. Muller (German Federal Republic), chaired by T. C. Hutchinson (Canada). Financial assistance for the Workshop and for subsequent editorial and reviewing activities were received from SCOPE (Paris), the National Research Council of Canada and from a Conference grant provided by the Natural Sciences and Engineering Research Council of Canada. Particular assistance as rapporteurs and chairmen of working groups at Toronto was provided by J. Jaworski and P. M. Stokes (Canada), S. Lindberg, A. L. Page and R. Chaney (USA), P. J. Peterson and M. Hutton (UK) and P. Buat-Ménard (France). Naomi Adamson provided the volume index, while typing help was provided by Karin Baird-Parisien. All manuscripts were externally and internally reviewed and thanks are given to the reviewers. In addition, the volume as a whole was reviewed by Dr D. Miller on behalf of the SCOPE executive. His critical and helpful comments proved most valuable.

General logistic support from SCOPE and from the Institute for Environmental Studies at the University of Toronto is gratefully acknowledged.
