

Intro to college math: Chapter 2.3
Solving Linear Equations in one Variable

* Linear equation one one variable: any equation that can be put in the form $Ax + B = C$.

* Contradiction: if the left side can never equal the right side. There is no solution.

ex.) $6x - 8 = 3 + 6x$

$$\begin{array}{r} \cancel{6x} - 8 = 3 + \cancel{6x} \\ -12x \quad -12x \\ \hline -8 = 3 \end{array} \quad \leftarrow \text{Not true}$$

* Identity: if the left side is always identically equal to the right side. The solution is "all real numbers".

ex.) $-15 + 3x = 3(x - 5)$

$$\begin{array}{r} -15 + 3x = 3x - 15 \\ \cancel{-3x} \quad \cancel{-3x} \\ \hline -15 = -15 \end{array} \quad \leftarrow \text{always true so ... "all real numbers"}$$

1. Solve the following equation for the given variable. $3(x - 1) = -15$

$$\begin{array}{r} 3(x - 1) = -15 \\ 3x - 3 = -15 \\ \quad +3 \quad +3 \\ \hline 3x = -12 \\ \quad \cancel{3} \quad \quad \cancel{3} \\ x = \boxed{-4} \end{array}$$

* First use distributive property to get rid of $()$.
Multiply the term outside the $()$ by both terms inside the $()$.

* Then move the number on the left to the right by doing the opposite (add/subtract).

* Then divide both sides by the number in front of the variable.

2. Solve the following equation for the given variable.

$$2(4x+1) = -22$$

$$2(4x+1) = -22$$

$$8x + 2 = -22$$

$$\frac{8x}{8} = \frac{-24}{8}$$

$$x = -3$$

* First use distributive property to get rid of (). Multiply the term outside the () by both terms inside the ()

* Then move the number on the left to the right by doing the opposite (add/subtract).

* Then divide both sides by the number in front of the variable.

3. Solve the following equation for the given variable.

$$-18 = 3(4a+2)$$

$$-18 = 3(4a+2)$$

$$-18 = 12a + 6$$

$$\frac{-24}{12} = \frac{12a}{12}$$

$$-2 = a$$

* First use distributive property to get rid of (). Multiply the negative sign outside the () by both terms inside the ().

* Then move the number on the right to the left by doing the opposite (add/subtract).

* Then divide both sides by the number in front of the variable.

4. Solve the following equation for the given variable.

$$15 = -3(4y-1)$$

$$15 = -3(4y-1)$$

$$15 = -12y + 3$$

$$\frac{12}{-12} = \frac{-12y}{-12}$$

$$-1 = y$$

* First use distributive property to get rid of (). Multiply the negative sign outside the () by both terms inside the ().

* Then move the number on the right to the left by doing the opposite (add/subtract).

* Then divide both sides by the number in front of the variable.

5. Solve the following equation for the given variable.

$$t - (2t + 5) = -1$$

$$\begin{aligned} t - (2t + 5) &= -1 \\ \underline{t - 2t - 5} &= -1 \\ -1t - 5 &= -1 \\ \underline{-1t - 5 + 5} &= \underline{-1 + 5} \\ -1t &= 4 \\ \underline{-1t} &= \underline{4} \\ t &= -4 \end{aligned}$$

- * First use distributive property to get rid of (). Multiply the negative sign outside the () by both terms inside the ().
- * Then combine like terms on either side of the equal sign.
- * Then move the number on the left to the right by doing the opposite (add/subtract).
- * Then divide both sides by the number in front of the variable.

6. Solve the following equation for the given variable.

$$-2x - (3x + 5) = 20$$

$$\begin{aligned} -2x - (3x + 5) &= 20 \\ \underline{-2x - 3x - 5} &= 20 \\ -5x - 5 &= 20 \\ \underline{-5x - 5 + 5} &= \underline{20 + 5} \\ -5x &= 25 \\ \underline{-5x} &= \underline{25} \\ x &= -5 \end{aligned}$$

- * First use distributive property to get rid of (). Multiply the term outside the () by both terms inside the ().
- * Then combine like terms on either side of the equal
- * Then move the number on the left to the right by doing the opposite (add/subtract).
- * Then divide both sides by the number in front of the variable.

7. Solve the following equation for the given variable.

$$2(y + 2) + 3 = 9$$

$$\begin{aligned} 2(y + 2) + 3 &= 9 \\ \underline{2y + 4 + 3} &= 9 \\ 2y + 7 &= 9 \\ \underline{2y + 7 - 7} &= \underline{9 - 7} \\ 2y &= 2 \\ \underline{2y} &= \underline{2} \\ y &= 1 \end{aligned}$$

- * First use distributive property to get rid of (). Multiply the term outside the () by both terms inside the ().
- * Then combine like terms on either side of the equal
- * Then move the number on the left to the right by doing the opposite (add/subtract).
- * Then divide both sides by the number in front of the variable.

8. Solve the following equation for the given variable. $3(4x-4)+1=-8$

$$3(4x-4)+1=-8$$

$$12x - 12 + 1 = -8$$

$$12x - 11 = -8$$

$$\frac{12x}{12} = \frac{3}{12}$$

$$x = \boxed{\frac{1}{4}}$$

* First use distributive property to get rid of (). Multiply the term outside the () by both terms inside the ().

* Then combine like terms on either side of the equal sign.

* Then move the number on the left to the right by doing the opposite (add/subtract).

* Then divide both sides by the number in front of the variable.

9. Solve the following equation. $-0.5(4t+1) = 0.5(3-2t)$

$$-0.5(4t+1) = 0.5(3-2t)$$

$$-2t - 0.5 = 1.5 - 1t$$

$$\frac{-1t - 0.5}{+0.5} = \frac{1.5}{+0.5}$$

$$\frac{-1t}{-1} = \frac{2}{-1}$$

$$t = \boxed{-2}$$

* First use distributive property to get rid of (). Multiply the term outside the () by both terms inside the ().

* Move the variable on the right to the left by adding or subtracting.

* Then move the number on the left to the right by doing the opposite (add/subtract).

* Then divide both sides by the number in front of the variable.

10. Solve the following equation. $-2(3y+1) = 3(4-y)+4$

$$-2(3y+1) = 3(4-y)+4$$

$$-6y - 2 = 12 - 3y + 4$$

$$-6y - 2 = 16 - 3y$$

$$\frac{-3y - 2}{+2} = \frac{16}{+2}$$

$$\frac{-3y}{-3} = \frac{18}{-3}$$

$$y = \boxed{-6}$$

* First use distributive property to get rid of (). Multiply the term outside the () by both terms inside the ().

* Combine like terms on either side of the - sign.

* Move the variable on the right to the left by adding or subtracting.

* Then move the number on the left to the right by doing the opposite (add/subtract).

* Then divide both sides by the number in front of the variable.
