CGIAR Research Initiative on
Aquatic Foods

Annual Technical Report 2023
CGIAR Technical Reporting has been developed in alignment with the CGIAR Technical Reporting Arrangement. This Initiative report ("Type 1" report) constitutes part of the broader CGIAR Technical Report. Each CGIAR Research Initiative submits an annual "Type 1" report, which provides assurance on Initiative-level progress towards End of Initiative outcomes.

The CGIAR Technical Report comprises:
- Type 1 Initiative, Impact Platform, and Science Group Project (SGP) reports, with quality assured results reported by Initiatives, Platforms and SGPs available on the CGIAR Results Dashboard.
- The Type 3 Portfolio Performance and Project Coordination Practice Change report, which focuses on internal practice change.
- The Portfolio Narrative, which draws on the Type 1 and Type 3 reports, and the CGIAR Results Dashboard, to provide a broader view on Portfolio coherence, including results, partnerships, country and regional engagement, and synergies among the Portfolio’s constituent parts.

The CGIAR Annual Report is a comprehensive overview of CGIAR’s collective achievements, impact and strategic outlook, which draws significantly from the Technical Report products above. For 2023, the Annual Report and Technical Report will be presented online as an integrated product.

---

This annual report provides the key achievements of the CGIAR Research Initiative on Aquatic Foods in 2023. During the year, Aquatic Foods made significant progress in delivering research from its four Work Packages (WPs) and strengthening partnerships and policy actions to start scaling key innovations in Bangladesh, Ghana, India, Kenya, Myanmar, Nigeria, Solomon Islands, Timor-Leste, and Zambia.

The Initiative 1) produced and disseminated research innovations for the sustainable development of aquatic food systems; 2) made substantial contributions to policy influence and change across the aquatic agri-food system at national and global levels in Africa, Asia, and the Pacific; and 3) provided improved knowledge and capabilities to Aquatic Foods research users, through a growing network of collaborators and development partners. The emerging evidence and innovations from the Initiative are laying a strong foundation to support the transformation of global food systems toward healthier, more inclusive, and sustainable diets and societies, where aquatic foods have a considerable role to play.

Notably, eight journal articles achieved significant attention in 2023, based on the number of citations, downloads, and Altmetric scores (>50). These explored the value of “blue” foods for sustainable food systems; the decolonization of ocean research for more equitable and effective ocean governance; the nexus between human rights and marine conservation; and the hidden economic, social, and food and nutrition security values of small-scale fisheries at global and national scales.

Aquatic Foods reported multiple innovations during 2023. Genetic research led to the production of Generation 17 of the faster-growing Abbassia tilapia strain in Egypt; Generation 0 of faster-growing genetically improved farmed tilapia (GFt) in Nigeria; Generation 2 of silver carp and a further batch of Generation 1 catla carp in Bangladesh; and Generation 19 of Tilapia Lake Virus (TLV)-resistant GIFT in Malaysia. In Bangladesh, WorldFish officially handed over the genetically improved third generation (G3) rohu to the Bangladesh Fisheries Research Institute. G3 rohu carp grow up to 30 percent faster than conventional rohu strains and could greatly benefit aquaculture in the country.

Data and digital research by Aquatic Foods focused on key digital innovations to 1) spread knowledge on aquatic species (FishBase), 2) collect and monitor data on the performance of aquatic food systems (PesKAAS), 3) connect fishers and farmers with value chain actors (MaCter Gari app), and 4) make public the Aquatic Food Ontology (AQFO).

Gender research focused on exploring gender dynamics in aquatic food systems. The team worked on the development of a gender equality and social inclusion strategy and guidelines for undertaking aquatic foods research-for-development through a gender lens.

Capacity sharing activities focused on establishing multistakeholder platforms and participatory consultation processes in Africa to support the scaling and adoption of Aquatic Foods innovations. In Bangladesh, Ghana, India, Myanmar, Nigeria, and Solomon Islands, close cooperation with national partners was key to supporting stakeholders in areas such as rice-fish systems, decision support tools, and cage farming. In Solomon Islands, Aquatic Foods promoted a multipurpose innovation hub at the WorldFish Nusaape Research Station to respond to the demand for a facility to convene research, training, and services with national and provincial partners.

---

**Executive summary**

This annual report provides the key achievements of the CGIAR Research Initiative on Aquatic Foods in 2023. During the year, Aquatic Foods made significant progress in delivering research from its four Work Packages (WPs) and strengthening partnerships and policy actions to start scaling key innovations in Bangladesh, Ghana, India, Kenya, Myanmar, Nigeria, Solomon Islands, Timor-Leste, and Zambia.

The Initiative 1) produced and disseminated research innovations for the sustainable development of aquatic food systems; 2) made substantial contributions to policy influence and change across the aquatic agri-food system at national and global levels in Africa, Asia, and the Pacific; and 3) provided improved knowledge and capabilities to Aquatic Foods research users, through a growing network of collaborators and development partners. The emerging evidence and innovations from the Initiative are laying a strong foundation to support the transformation of global food systems toward healthier, more inclusive, and sustainable diets and societies, where aquatic foods have a considerable role to play.

Notably, eight journal articles achieved significant attention in 2023, based on the number of citations, downloads, and Altmetric scores (>50). These explored the value of “blue” foods for sustainable food systems; the decolonization of ocean research for more equitable and effective ocean governance; the nexus between human rights and marine conservation; and the hidden economic, social, and food and nutrition security values of small-scale fisheries at global and national scales.

Aquatic Foods reported multiple innovations during 2023. Genetic research led to the production of Generation 17 of the faster-growing Abbassia tilapia strain in Egypt; Generation 0 of faster-growing genetically improved farmed tilapia (GFt) in Nigeria; Generation 2 of silver carp and a further batch of Generation 1 catla carp in Bangladesh; and Generation 19 of Tilapia Lake Virus (TLV)-resistant GIFT in Malaysia. In Bangladesh, WorldFish officially handed over the genetically improved third generation (G3) rohu to the Bangladesh Fisheries Research Institute. G3 rohu carp grow up to 30 percent faster than conventional rohu strains and could greatly benefit aquaculture in the country.
Section 2: Progress on science and towards End of Initiative outcomes

Initiative-level theory of change diagram

This is a simple, linear, and static representation of a complex, non-linear, and dynamic reality. Feedback loops and connections between this Initiative and other Initiatives’ theories of change are excluded for clarity.

Note: A summary of Work Package progress ratings is provided in Section 3.
Summary of progress against the theory of change

The Aquatic Foods Initiative impacts nutrition, health, poverty reduction, gender equality, environmental health, and climate through four WPs: AquaData (WP1), AquaPartners (WP2), AquaPlans (WP3), and AquaGenetics (WP4). The Initiative focuses on generating better understanding of aquatic food systems across the world, from production to consumption, as well as their social, environmental, and economic impacts. The Initiative is led by WorldFish, the Department of Fisheries (DoF), the Bangladesh Council of Scientific and Industrial Research (BCSIR), the National Fisheries Research and Development Institute (NFRDI), and the United Nations Development Programme (UNDP).

Key studies in Bangladesh, Egypt, Myanmar, and Pakistan explored the impact of adopting aquatic foods on the productivity, livelihoods, and food security of small-scale aquaculture producers, and benchmarked the sustainability performance of aquatic food production systems. The studies found that 1) simplification of small-scale fish farming can make a positive contribution to the sustainable intensification of aquaculture in some geographic areas and 2) adoption of improved practices and improved implementation of small-scale aquaculture BMPs, combined with nutrition training, has enormous potential to transform rural livelihoods. They also identified the sustainable characteristics of fish production systems, unveiling their economic and environmental impacts and implications for food security.

In 2023, 1,784 people received formal training from Aquatic Foods, of whom one-third were women. In Africa, capacity-sharing activities focused on establishing multistakeholder platforms and participatory consultation processes in Ghana, Kenya, Nigeria, Tanzania, and Zambia. These brought together governments, nongovernmental organizations (NGOs), the private sector, farmers’ associations, small-scale fisheries, farmers, processors, and others. In Bangladesh, Ghana, India, Myanmar, Nigeria, and Solomon Islands, there is close cooperation with national partners for the training of stakeholders in areas related to sustainable aquatic food systems such as rice-fish systems, data systems and data collection, and sustainable fish farming. In Bangladesh, WorldFish handed over 120 rice-fish BMPs to BFRI. For the development and implementation of small-scale aquaculture BMPs, with novel partnerships, and the contribution of aquaculture to SDGs on improved health, food security, and nutrition, and water, sanitation, and hygiene practices. It was used in 2023 by 11,646 people (524 women) including farmers, extension agents, and other private sector operators. Aquatic Foods researchers and partners also finalized the development of the WorldFish data model to enable easy aggregation and analysis of data generated by the Initiative. It is available on AquaStats and is based on the UN’s Food and Agriculture Organization (FAO)’s AGROVOC terminology.

In WP2, a social platform for indigenous food security in Papua New Guinea with novel partnerships spanning cultural, environmental, and livelihood sectors in West Papua to support the integration of aquaculture into the government’s “One Village, One Dam” program, the government of Odisha (India) committed to working with WorldFish scientists to support the livelihoods and nutrition of 5,000 women in self-help groups. Gender research focused on capturing promising learning areas from previous CGIAR programs, and co-producing key knowledge products. It also undertook research to integrate the importance of sex- and gender-disaggregated data into aquatic food systems; explore gender dynamics in aquatic food systems; lead gender integration and research activities within the different WPs; conduct gender capacity development among research teams; and scale up the Women’s Empowerment in Fish and Aquaculture Index. In addition, the team worked on a global partnership and social inclusion strategy to guide aquatic food research-for-development. Finally, new policies were identified as key drivers of gender transformative approaches (GTAs) in the agricultural research-for-development ecosystem of organizations, while also raising concerns about the rush to embrace GTAs.

Supplementary Nutrition Program to tackle malnutrition in Asia, India. In Ghana, Aquatic Foods and partners contributed to the integration of aquaculture in the design of the government’s “One Village, One Dam” program. Finally, the government of Odisha (India) committed to working with WorldFish scientists to support the livelihoods and nutrition of 5,000 women in self-help groups. Gender research focused on capturing promising learning areas from previous CGIAR programs, and co-producing key knowledge products. It also undertook research to integrate the importance of sex- and gender-disaggregated data into aquatic food systems; explore gender dynamics in aquatic food systems; lead gender integration and research activities within the different WPs; conduct gender capacity development among research teams; and scale up the Women’s Empowerment in Fish and Aquaculture Index. In addition, the team worked on a global partnership and social inclusion strategy to guide aquatic food research-for-development. Finally, new policies were identified as key drivers of gender transformative approaches (GTAs) in the agricultural research-for-development ecosystem of organizations, while also raising concerns about the rush to embrace GTAs.

Summary of progress against the theory of change

The Aquatic Foods Initiative impacts nutrition, health, poverty reduction, gender equality, environmental health, and climate through four WPs: AquaData (WP1), AquaPartners (WP2), AquaPlans (WP3), and AquaGenetics (WP4). The Initiative focuses on generating better understanding of aquatic food systems across the world, from production to consumption, as well as their social, environmental, and economic impacts. The Initiative is led by WorldFish, the Department of Fisheries (DoF), the Bangladesh Council of Scientific and Industrial Research (BCSIR), the National Fisheries Research and Development Institute (NFRDI), and the United Nations Development Programme (UNDP).

Key studies in Bangladesh, Egypt, Myanmar, and Pakistan explored the impact of adopting aquatic foods on the productivity, livelihoods, and food security of small-scale aquaculture producers, and benchmarked the sustainability performance of aquatic food production systems. The studies found that 1) simplification of small-scale fish farming can make a positive contribution to the sustainable intensification of aquaculture in some geographic areas and 2) adoption of improved practices and improved implementation of small-scale aquaculture BMPs, combined with nutrition training, has enormous potential to transform rural livelihoods. They also identified the sustainable characteristics of fish production systems, unveiling their economic and environmental impacts and implications for food security.

In 2023, 1,784 people received formal training from Aquatic Foods, of whom one-third were women. In Africa, capacity-sharing activities focused on establishing multistakeholder platforms and participatory consultation processes in Ghana, Kenya, Nigeria, Tanzania, and Zambia. These brought together governments, nongovernmental organizations (NGOs), the private sector, farmers’ associations, small-scale fisheries, farmers, processors, and others. In Bangladesh, Ghana, India, Myanmar, Nigeria, and Solomon Islands, there is close cooperation with national partners for the training of stakeholders in areas related to sustainable aquatic food systems such as rice-fish systems, data systems and data collection, and sustainable fish farming. In Bangladesh, WorldFish handed over 120 rice-fish BMPs to BFRI. For the development and implementation of small-scale aquaculture BMPs, with novel partnerships, and the contribution of aquaculture to SDGs on improved health, food security, and nutrition, and water, sanitation, and hygiene practices. It was used in 2023 by 11,646 people (524 women) including farmers, extension agents, and other private sector operators. Aquatic Foods researchers and partners also finalized the development of the WorldFish data model to enable easy aggregation and analysis of data generated by the Initiative. It is available on AquaStats and is based on the UN’s Food and Agriculture Organization (FAO)’s AGROVOC terminology.

In WP2, a social platform for indigenous food security in Papua New Guinea with novel partnerships spanning cultural, environmental, and livelihood sectors in West Papua to support the integration of aquaculture into the government’s “One Village, One Dam” program, the government of Odisha (India) committed to working with WorldFish scientists to support the livelihoods and nutrition of 5,000 women in self-help groups. Gender research focused on capturing promising learning areas from previous CGIAR programs, and co-producing key knowledge products. It also undertook research to integrate the importance of sex- and gender-disaggregated data into aquatic food systems; explore gender dynamics in aquatic food systems; lead gender integration and research activities within the different WPs; conduct gender capacity development among research teams; and scale up the Women’s Empowerment in Fish and Aquaculture Index. In addition, the team worked on a global partnership and social inclusion strategy to guide aquatic food research-for-development. Finally, new policies were identified as key drivers of gender transformative approaches (GTAs) in the agricultural research-for-development ecosystem of organizations, while also raising concerns about the rush to embrace GTAs.
Progress by End of Initiative Outcome

EOIO 1: Scaling partners and stakeholders in two countries use improved knowledge systems and data to inform at least five evidence-based investments supporting aquatic foods systems transformation.

Significant progress in delivering research outputs and outcomes in 2023 along the TOC. The government of Timor-Leste continued its investment in PeIAAS. Over 35,000 km of the country’s coastline was under improved management thanks to this investment. PeIAAS, a real-time monitoring system for fisheries, became part of a major investment by the FDPO to support fishery management in Kenya, Mozambique and Tanzania. Additionally, two public-private platforms, FishBase and AquaData, facilitated data and knowledge exchange in 2023, with FishBase attracting 700,000 monthly users and AquaData being refined for wider use. Research informed policy updates in Bangladesh and India, while a collaborative effort supported the revision of Nigeria’s National Fisheries and Aquaculture Policy.

EOIO 2: Improved management and co-production of sustainable development pathways secure rights and livelihood benefits for 50,000 small-scale actors in aquatic foods systems in Asia-Pacific and bring more nutritious diets to 300,000 people.

In the Solomon Islands, the Nusatupe innovation hub, established by Aquatic Foods, offers training and knowledge-sharing, featuring a food garden, environmental restoration, seaweed farming, and aquaculture, and completed its first youth internship for six rural youths. In Timor- Leste, Aquatic Foods contributed to the national school meal program, incorporating more than 6 tons of fish powder into 35,000 students’ meals in 2023. Meanwhile, in India, the focus was on promoting fish and fish-based products via the Mission Shakti system and women’s self-help groups.

EOIO 3: Improved food, livelihood, water, and environmental performance in multifunctional land and water systems in Myanmar, Cambodia, Ghana, and Zambia.

Research aligned with the TOC yielded five key innovations, including three decision support tools for sustainable aquaculture in Cambodia, Ghana, and Myanmar, and two tools supporting inclusive governance in Ghana and Zambia. These innovations were backed by knowledge products and a robust capacity-building component, directly benefiting more than 400 stakeholders (fishers, farmers, private sector representatives, extension agents, policymakers) in Cambodia, Ghana, Myanmar, and Zambia.

EOIO 4: At least one of tilapia and carp strains demonstrate increased productivity (+30 percent) and environmental performance (-25 percent GHG emission reduction) in one African and two Asian countries.

The transfer of the GIFT tilapia strain to Nigeria marks the beginning of a GIFT-based aquaculture industry there, with the development of best management practices (BMPs) and the production of a high-performing G10 generation. In Bangladesh, Generation 3 rohu carp, growing more than 30 percent faster than traditional strains, was introduced to enhance aquaculture production, supporting a significant market.

EOIO 5: Aquatic food system labs in Solomon Islands and Zambia increase national innovation systems’ ability to identify, evaluate, and scale sociotechnical innovations.

In Solomon Islands, the Nusatupe innovation hub established by Aquatic Foods responds to the national demand for a training and knowledge-sharing facility. Seven demonstration sites were established, including a 100 m² food garden, an environmental restoration site (coral replanting), a seaweed farm, and an aquaponic system.

In the Solomon Islands, the Nusatupe innovation hub established by Aquatic Foods responds to the national demand for a training and knowledge-sharing facility. Seven demonstration sites were established, including a 100 m² food garden, an environmental restoration site (coral replanting), a seaweed farm, and an aquaponic system. Several demonstration sites were established, including a 100 m² food garden, an environmental restoration site (coral replanting), a seaweed farm, and an aquaponic system.

Work Package 1 progress against the theory of change

WP1 (AquaData) made substantial progress in delivering research outputs and outcomes in line with its TOC. Twenty-seven knowledge products were produced, including 14 peer-reviewed articles. Key publications focused on closing the knowledge gap about the contribution of small-scale fisheries to 1) sustainable development, and 2) the sustainability of production systems and practices in Bangladesh, Egypt, India, Myanmar, and Pakistan. These provide the foundation for understanding the sustainability performance and trade-offs between sustainability outcomes for aquatic foods systems across different contexts.

Thirteen new innovations were under development in 2023, while four were already in use in Bangladesh, Timor-Leste, and globally. These focused on addressing data gaps and needs in aquatic foods systems and/or developing key digital ecosystems and solutions to support data gathering and sharing. The innovations have been key in delivering research outputs and outcomes in line with the AquaData research plan. Key innovations were related to the definition of the monitoring, evaluation, and learning framework for sustainable small-scale fisheries produced with FAO and the International Center for Agricultural Research in the Dry Areas. This is now promoted as a key tool for the implementation of the voluntary guidelines for sustainable small-scale fisheries worldwide.

In addition, AquaData has been promoting the adoption of the new ACCO in the fisheries and aquaculture space. AquaData and partners continued the development of the first-ever Data for Action Portal on aquatic foods systems, with an improved framework of indicators for sustainable aquatic foods (AquaIndicators).

AquaData worked on six policy changes in 2023. These related to key recommendations and actions required to close data gaps relating to aquatic foods in Bangladesh and India, and the review and update of Nigeria’s National Fisheries and Aquaculture Policy.

Twenty capacity-sharing activities were implemented in countries including Bangladesh, India, Kenya, Malaysia, Nigeria, and Zambia.
WP2: Aqua+Partners

Delayed

Outcome

- Community access rights and management systems supported for improved and equitable governance of aquatic resources.
- National parks and programs better align with community needs and aspirations, supporting social, economic, and environmental sustainability.
- New knowledge on how local and national governance structures can address water and food security challenges.
- Innovative research and partnerships that create spaces for capacity-building and collective action, such as the Aqua+Fish Lab in Cambodian and Zambian settings.
- New research for development co-creation (learning by doing) and participatory governance initiatives leading to strong ownership and accountability mechanisms.
- Communication materials (e.g., blogs, videos, interactive models and activities) engaged more than 400 stakeholders.

ICOS

- Aquatic food system labs in Solomon Islands and Zambia are established to test and scale bio-social solutions.
- Integrated monitoring and co-production of sustainable development pathways secure access to nutritious diets for 160,000 small-scale aquaculture actors in aquatic food systems. In Aqua+Fish and long-term nutritious diets to 300,000.
- Innovative partnerships engaged more than 400 stakeholders.

WP3: AquaPlans

Outcome

- Rice and fish decision support tool deployed at at least two partner organizations.
- Policy support design and implementation principles of rice and fish decision support tool.
- Vibrant partnerships with scaling partners using learning on rice and fish integrated production systems to adapt their programs.
- Policy support for the design and implementation of aquaculture food production in small dams.
- Aquaculture food production in small dams is piloted at least four sites.
- Vibrant multi-stakeholder platforms at the national and sub-national levels mobilizing evidence to include aquaculture food production and fish-friendly irrigation principles into project design and policies.
- Teriary education module on fish-friendly irrigation and integrated production systems developed and delivered in water planners and engineers' degrees.

Output

- Improved food, livelihood, and water management performance in multifunctional land and water systems in Mozambique, Cambodia, Ghana and Zambia.
- Food security and nutrition are improved for local households through increased consumption of nutritious fish.
- Enhanced capacity of local institutions in the design and implementation of multi-stakeholder platforms for local governance.

WP2 (Aqua+Partners) delivered on key activities in the TOC and was able to make progress in all areas, despite significant budget cuts. In Solomon Islands, Aqua+Partners created a social platform for the Nasutape innovation hub for island food systems. The hub responded to national demand for a training and knowledge sharing facility. Several demonstration sites were set up including a 100 m² seaweed farm, and an aquaponic system. The hub completed the first round of youth internships with six rural youth (three men and three women). The hub hosted an international forum on scaling community-based resource management with regional partners such as The Pacific Community, WMP, WCS, and LMKM International.

In Timor-Leste, Aqua+Partners convened partners from several sectors of society involved in the national school meal program. This program was identified as a significant lever for national aquatic food integration for nutrition outcomes. The team also assessed pathways for securing a sustainable supply of aquatic foods and the extent of adoption by partners, with one serving more than 6 tons of fish powder to 35,000 school students during 2023. In India, a similar focus was retained with a strong emphasis on fish and fish-based products through the Mission Shakti and with women's self-help groups. Here, the team also led the development and completion of the first national assessment of aquatic food consumption to provide our policy partners with options.

In 2023, WP3 (AquaPlans) focused on finalizing designs and upscale innovations. It delivered 19 knowledge products, including open-access journal articles, reports, manuals, and briefs. Partners and colleagues assessed fish-friendly irrigation guidelines previously published for the Lower Mekong, while Food and colleagues and Ramamurthy and colleagues considered the impact of fish-friendly irrigation and integrated production systems to adapt their programs. Integrated production systems continued to be a focus with Ignowi and colleagues showing evidence of the impact of integrating terrestrial aquatic foods on nutrient and economic productivity.

Five innovations were under development: the decision support tool for sustainable aquaculture development, the suitability tool for scaling aquaculture in small reservoirs, rice-fish suitability decision support system, model fish cage production in small reservoirs, and a multi-stakeholder platform for managing complex and multifunctional landscapes. Development and scaling of innovations were supported by knowledge products capacity building of more than 400 stakeholders (including fisheries, farmers, private sector representatives, extension agents, and policymakers) in Cambodia, Ghana, Myanmar, and Zambia.

Aqua+Partners’ research also contributed to policy formulation for sustainable aquatic food systems. Pilots of cage fish culture in four reservoirs in northeastern Ghana and suitability mapping to upscale the pilots to additional locations were taken up by the One Village, One Dam program (phase 2), with the potential to integrate aquaculture into the design (or rehabilitation) of other reservoirs. In Cambodia and Zambia, MSP processes are supported by local government institutions as a way of enhancing the governance of multifunctional landscapes.

Most deliverables planned for 2023 were met and all key deliverables critical to achieving the outcomes planned in the 2023 TOC were completed. Therefore, the WP is going in the right and expected direction. However, budget cuts in 2023 required significant changes to plans and will affect the overall achievements of the WP going forward. Prioritization of research and scaling activities will be necessary to ensure the successful delivery of key innovations.

As a whole, the WP is making progress in the intended direction and with the right focus on levers of change identified with partners. However, the much-reduced funding and associated uncertainty in planning is continuing to influence the pace and scale of implementation. This affects our assumptions of being impactful by building capacity, forming change coalitions, and influencing system-level change. These assumptions require the original scale of intent for the budget.

Annual progress made in 2023 in WP3 aligns with the plan of results and the TOC defined at the design stage of the initiative. Outputs have been delivered as per the results framework under the three pathways and are now being translated into intermediary outcomes. Actual spending, which fell behind the initial plan in 2022, has satisfactorily caught up in 2023.

Annual progress was delayed in the delivery of a few activities due to both technical and logistical issues, and budget uncertainty, which seems to characterize the implementation of the CGIAR Research Initiatives. Revision of the TOC and prioritization of activities will be continued in 2024, in order to cope with changes in the implementation of genetics activities and scaling of key genetic innovations.
Section 4: Key results

This section provides an overview of results reported by the CGIAR Research Initiative on Aquatic Foods in 2023. These results align with the CGIAR Results Framework and Aquatic Foods’ theory of change. Source: Data extracted from the CGIAR Results Dashboard on 29 March 2024.

**Partnerships and Aquatic Foods’ impact pathways**

In 2023, Aquatic Foods was engaged in 305 active external partnerships, 214 of which were established during the year. Academic and research organizations made up 52 percent of partners, but there was significant growth in partnerships with national agriculture research systems (14 percent) and governments (19 percent). This reflects greater attention to delivering innovations and outcomes with partners at scale through policy contributions, commercialization, and capacity-building partners. Most of the partnerships remained focused on innovation development (45 percent), while those relating to scaling accounted for 18 percent.

The initiative supported WorldFish to build key partnerships in Nigeria and Bangladesh, in relation to the adoption of faster-growing strains of tilapia and/or carp respectively.

In Solomon Islands, the initiative successfully integrated aquatic foods into the traditional agricultural movement under the headline of Indigenous foods. The in-country partner, Kastom Gaden Association, which manages a network of 10,000 farmers, has now gained access to training and information about safe aquatic food handling and processing (farmers are also fishers). This work has created a new social platform for the Indigenous foods movement.

In Timor-Leste, Aquatic Foods successfully integrated research and diverse partners under the program on school feeding. Here, aquatic foods have taken a central role in the planning and procurement of meals for young school children.

In Myanmar, key partnerships have been consolidated with the Department of Agriculture, Department of Planning, and DOF, under the Ministry of Agriculture, Livestock and Irrigation, to play a key role...
In co-designing and deploying innovative approaches to rice and fish integrated production systems.

In Ghana, the Council for Scientific and Industrial Research and the Fisheries Commission, Ministry of Fisheries and Aquaculture Development, co-lead the implementation of a pilot project on fish cage production in small reservoirs, and are key in influencing the scaling of the innovation beyond the pilot.

In Zambia, the multistakeholder platform was launched under the auspices of the Ministry of Fisheries and Livestock.

In Cambodia, Aquatic Foods formally partnered with the Inland Fisheries Research and Development Institute, whose role is to jointly contribute to research and policy uptake. Building partnerships with national agricultural research and extension systems, particularly the DoF or their equivalent in target countries, was key in 2023. In several cases, such as in India, Ghana, Solomon Islands, Timor-Leste, and Zambia, this involved supporting the department and/or other key traditional partners to work together on common investments and development plans for the fisheries and aquaculture sectors.

The cooperation with FAO and Duke University on the Illuminating Hidden Harvests initiative contributed to global policymaking and produced key knowledge around the role of small-scale fisheries in food security in various contexts. FAO is an important partner for the initiative and more than 10 outputs were produced in collaboration with them. Aquatic Foods and FAO also co-developed a novel participatory monitoring, evaluation, and learning framework to support the transparent implementation of the voluntary guidelines for securing sustainable small-scale fisheries in the context of food security and poverty.

Section 6: CGIAR Portfolio linkages

Cross-CGIAR collaborations and portfolio linkages have been very important for the Aquatic Foods Initiative and were pursued in various ways during 2023. The Initiative cooperated closely with the Gender Impact Platform and two regional Initiatives—Asian Mega-Deltas and Diversification in East and Southern Africa (Ukama Utskawi). Together, the Gender Impact Platform and Aquatic Foods co-produced nine knowledge products including 1) a journal article aiming to explore the status of women’s empowerment in the aquaculture sector in Kenya, 2) a report exploring gender-equal access and control over resources, technology, and information among smallholder farmers in climate change hotspots in Africa, and 3) a technical workshop report about climate change, gender, and livelihoods among fisher communities in Kenya’s Lake Victoria region.

Aquatic Foods actively contributed to the CGIAR Gender Conference in New Delhi, India. This event was an important opportunity for Initiative researchers to share their experiences and current strategy for aquatic foods, learn from existing gender research, and enhance capacities for quality and impactful gender research that will advance CGIAR’s 2030 development targets.

Linkages with the Asian Mega-Deltas and Diversification in East and Southern Africa Initiatives support the delivery of the TDC and End of Initiative outcomes in Asia and Africa. In Cambodia, close collaboration between WP3 of Aquatic Foods and WP4 of Asian Mega-Deltas allows the work on water and land foodscapes governance to be delivered more effectively and at a larger scale.

Finally, in Zambia, Aquatic Foods works with Diversification in East and Southern Africa to govern and enable sustainable diversification and intensification of aquatic food systems and applied the scaling readiness approach for promising innovations in Africa.

Connections are sized by the number of reported results. Collaborations where only one result was reported with a linkage between two Initiatives are excluded.
Section 7: Adaptive management

In 2023, the Initiative team conducted a “pause and reflect” process to better understand some of the major green lights and roadblocks in the second year of implementation. It focused on a series of discussion points such as operationalization and implementation processes, science delivery, gender integration, results and roadmap to impact, budgeting, TDC, partnerships, and engagement, risks, and next cycle. Many of the challenges identified in the first year remained relevant in 2023. Among these, the limited Initiative cycle duration, budget allocation uncertainty, and continuous budget cuts were seen as major roadblocks affecting the success of the Initiative in many aspects. In the short term, these limit opportunities for engagement and collaboration across WPs and, across CGIAR, they limit the depth and breadth of research activities and compromise trust and relationship building with partners.

The differences between the expected/promised and actual allocated budget created the need to continuously plan and review activities and partner engagement. As a consequence, in 2023, significant revisions were made to the TDC, including the complete withdrawal of WPS, whose aim was to build synergies among all WPs and support the scaling of innovations. Other WPs were also forced to reduce the scale of their activities, thus affecting the reach of the outcomes (now reduced by 50–60 percent). Over the long term, time and budget limitations affect the Initiative’s capacity to align with scaling and generate impact. With regard to future portfolio developments, it is recommended that such considerations are taken into account. Stronger financing and longer cycles would ensure sustainability and continuity of innovation and scaling efforts, which otherwise risk being fragmented and lost.

On the operational side, CGIAR-led administrative and financial procedures are still perceived as quite demanding, adding further layers to existing Center policies and structures. The processes and guidelines are not always easy to follow, and the number of focal and contact points is too high and difficult to keep track of. In addition, the management information systems (MIS) do not function well; there are too many platforms serving different purposes (such as the TDC tool, performance and results management, risk tool). These have limited functionalities and there is no linking/synchronicity with existing Center systems.

Internally, we appraised Initiative-specific management procedures and meetings established to facilitate communication and knowledge sharing within the Aquatic Foods teams, and to ease the administrative load. Better efforts are encouraged on knowledge exchange platforms and communication across Initiatives, Centers, and stakeholders to create stronger synergies, engender better adaptive processes, and take advantage of opportunities for learning. On this note, it is strongly recommended that the new investment cycle builds up the work that has been done under the Aquatic Foods Initiative to support a science continuum and scaling.

**RECOMMENDATION**

- Strengthen communication and increase synergies across WPs and with other CGIAR initiatives and non-pooled funding
  - The withdrawal of WP5 was the result of significant budget cuts. WP5 was supposed to serve as a connector between WPs and support more collaboration and linkages. Its withdrawal affected communication exchange and collaboration opportunities internally and externally. Knowledge exchange platforms convened at the country level could create better synergies and links with other initiatives and projects.

- Improve country-level infrastructure and financial resource allocation to better support initiatives
  - In-country support for Initiative implementation and engagement is seen as a constraint and not efficient enough. This is particularly relevant in those cases where contributing CG Centers do not have country offices in the geographies of interest and need to rely on other CG Centers or partners’ local offices, and often there is no staff time or budget allocated. In the first two years of implementation, this has made it hard to coordinate, disrupting the ability to implement in-country activities. Coordinated efforts between Centers and greater financial resources could support better operational activities in countries.

- Increase funding allocation and reduce uncertainties from CGIAR, including better synergies with non-pooled funding
  - With regard to the investment cycle for new Initiatives, it is necessary to consider adequate financial resources and better budget allocation processes that can support the delivery of quality science and scaling for impact in a more robust way.

- Continue focusing on priorities on key science delivery and quality
  - In the final year of implementation, considering budget constraints, the Initiative will continue to build the publication pipeline with a focus on key priorities, science quality, and sustainability.

- Ensure Aquatic Foods’ science sustainability and continuum in the next portfolio
  - Aquatic Foods has been delivering great results and the science behind these should be integrated into the next investment cycle. It is important to ensure the continuity of existing innovations and scaling work to ensure greater impact is generated as a result. Longer duration of Initiative cycles would also contribute toward this.

- CGIR and Centers to coordinate efforts in improving the MIS and administrative procedures to better facilitate initiatives in the implementation process and sharing of results
  - The lack of integration of CGIAR systems and procedures with those of the Centers has resulted in an increased burden on the Initiative, especially in planning and reporting processes. Better coordinated efforts are needed to streamline processes and tools that can support Initiatives more efficiently and effectively.

- Increase resource allocation to better support gender research and integration and capacity sharing for development
  - Reduction in actual funding has influenced the capacity for great gender research and integration, and capacity building and sharing opportunities. The PhD programs have been particularly affected. This is also due to the short duration of the Initiative cycle.

- Continue improving the multistakeholder engagement and consultation processes
  - Continuing to invest in multistakeholder engagement and consultation appears to have a positive effect on improving policy development and innovation adoption across geographies in support of more sustainable aquatic food systems.
The government of Nigeria wants to boost sustainable aquaculture countrywide. In 2023, a breeding population of fast-growing GIFT was established in the country, successfully producing young fish for distribution to hatcheries and farmers. This achievement was the result of work by scientists at WorldFish in collaboration with the Federal Ministry of Agriculture and Food Security, Premium Aquaculture Ltd (PAL), and other national partners.

In 2023, scientists from the CGIAR Research Initiative on Aquatic Foods in Nigeria reached important milestones in supporting the establishment of an industry for GIFT in the country.

Fish are already critical to diets and the economy in Nigeria, but around 45 percent of demand is met through imports. With abundant inland water resources, there is significant scope to expand homegrown aquaculture and respond to the demands of a population expected to leap from 196 million to 260 million by 2030.

While catfish accounts for more than 80 percent of aquaculture in the country, dependence on a single species is risky: disease could sweep through hatcheries and farms, wiping out stocks. In addition, signs of inbreeding in the country’s catfish populations have resulted in reduced growth and survival rates of the fish.

As part of the government’s five-year Agricultural Technology and Innovation Policy, launched in 2022, scientists from Aquatic Foods have been working on pioneering approaches to boost aquaculture. These aim to meet local protein needs, reduce imports, improve climate change resilience, empower the country’s smallholders, and create 500,000 new jobs in the aquaculture value chain.

Initiative scientists identified GIFT as being a good option for supporting these aims. GIFT is a strain of Nile tilapia that has benefited from multiple generations of selective breeding. It is fast growing, adaptable to a wide range of conditions, and—as an herbivore—it’s feed requirements are cheaper than other farmed fish, making it attractive to smallholders. GIFT also provides many of the same nutritional benefits as other fish, namely zinc, iron, Vitamin A, calcium, and protein.

In 2022, WorldFish teamed up with PAL, a hatchery and fish farm in Ogun State. As part of the partnership, 60,000 GIFT “swim-up fry” (very young fish) were packed into polythene bags with oxygenated water and flown from WorldFish headquarters in Malaysia to PAL, where they entered a mandatory month-long quarantine period. In 2023, the now-adult fish were used to produce a GIFT breeding population. The resulting progeny were supplied to farmers and hatcheries to establish their own production.

During 2023, onsite trials at the PAL hatchery involving local fish feed producer Premier Feed Mills showed that GIFT were performing well. Under different feeding regimes, they showed faster rates of growth and more efficient feed conversion than nonimproved fish already used by PAL. These should mean higher production, lower costs, and potentially more earnings for farmers.

The Initiative also supported the establishment of a breeding population at a PAL site in Ogun State and two small-scale hatcheries in Delta State, including pilot “grow-out” ponds for raising fish to market size. In November, PAL started supplying the second generation of GIFT fry to farmers.

“This is the best possible start for the introduction of GIFT in Nigeria,” said Sunil Sriwirdana, of WorldFish, who leads the work of Aquatic Foods in the country. “At hatcheries, we’re seeing GIFT doing what they do best: resisting disease and quickly reaching a harvestable size, while the response from farmers has been overwhelmingly positive. We expect GIFT will be a huge asset in strengthening and expanding fish farming in Nigeria and supporting the government in achieving its aquaculture goals.”

In 2023, the Initiative produced a range of learning materials for hatcheries and farmers, including a handbook on BMPs for raising Nile tilapia. It also produced a curriculum on tilapia breeding, rearing, and grow-out farming, which was used to train around 200 farmers, approximately two-thirds of whom were women.

The work has a broader goal of decentralizing the production of GIFT seed to improve farmers’ access to it. A special focus is needed on boosting aquaculture in the northern region of the country, where fish farming and fish consumption is lower than in the south.
