

Research Paper Writing Service for Universities

The very first thing is to correctly identify the topic and clearly articulate it. This is very important, because the topic reflects the essence of your work, if the work does not correspond to the stated topic, then the work itself turns out, as it were, not! You have not completed what you stated in the topic. In the course of all work, make sure that your research corresponds to the given topic, does not deviate to the side. The findings were also consistent with the theme and goals set. To correctly determine the topic, you need to take some element of events, and not a whole big event, otherwise you will not overcome such a volume with a deep immersion of the question (for the study is precisely a deep immersion in the question). Consult the topic wording with your teacher.

The amount of work may vary depending on the complexity of the topic. For a student, this is 10-25 sheets of printed text without taking into account applications. Text is printed on only one side of an A4 sheet.

Requirements for writing and designing research work

The main stages of research work are the following provisions:

Finding a problem - what you need to study.

The topic is what to call it.

Relevance - why this problem needs to be studied.

The purpose of the study is what result is expected to be obtained.

Hypothesis - which is not obvious in the object.

Novelty - what's new in the study.

Research objectives - what to do - theoretically and experimentally.

Literature review - what is already known on this issue.

Research technique - how and what was investigated.

Research results - own data.

Conclusions - short answers to the tasks.

Significance - how the results influence practice.

1. The goals and objectives of the research work

The research work is an independently conducted study of the student, revealing his knowledge and the ability to apply them to solve specific practical problems. The work should be logically completed and demonstrate the ability of the student to competently use special terminology, clearly state their thoughts, substantiate proposals.

The objectives of the research work are:

-development of skills of independent research activities and their application to solving urgent practical problems;

-conducting an analysis of the theoretical approaches existing in domestic and foreign science that are part of the scope of the study;

-conducting independent research on selected issues;

- demonstration of skills to systematize and analyze the data obtained during the study;
- inculcation of interest in scientific activity.

2. Organization of work

2.1. Research Problem Advancement

Scientific research work is a search research aimed at identifying and, possibly, solving a problem. In science, a problem is understood as a contradictory situation arising as a result of the discovery of new facts that clearly do not fit into the framework of the previous theoretical positions.

The nomination of problems for students for scientific research should be based on the facts of the world. Observation and analysis of human interaction with nature, technology,

information systems, society, other people, as well as self-knowledge, can help a schoolchild to discover a problematic situation that needs to be studied.

2.2. The algorithm of work on a scientific problem

There is a single algorithm that reflects the staged work on the research problem of a specialist at any level: the choice of problem;

- collecting information on knowledge already available in science on the issues being studied;
- analysis and generalization of knowledge on the problem;
- concept development and research planning;
- selection of research methods and techniques;
- conducting research;
- processing the received data;
- written design of theoretical and empirical material in the form of a holistic text;
- submission of work for review;

performance representation and job protection.

2.3 Structural components of research

- The structure of the work should be presented as follows:
- title page;
- content;
- introduction;
- chapters of the main part;
- conclusions;
- conclusion;
- list of references;
- applications.
