Composable Index Templates

David Pilato ([@dadoonet](https://twitter.com/dadoonet))

Developer | Evangelist

What's wrong with Legacy Templates?

aka Index Templates V1

One template is easy to manage

- But: it means a **lot of duplication** of index templates
- Or need to use multiple templates to compose a final one

Merging templates when no order defined or same order

- Can result in **invalid settings and mappings**
- **No validation**
- Which you discover only **when the index is created**

Harder to maintain

- ie. How the templates are going to be applied and which ones

Composable Index Templates

aka Index Templates V2

Same as index templates (applied at index creation time)

But:

- **Must be valid.**
- **Not merged.** The one with highest priority is used.
- **Composable** with Component Templates which defines optionally
 - index settings
 - mappings
 - aliases

Consequences:

- Predictable
- Stable
- Easier to manage
