PERFIS – Minimalist 3D Printed Tabletop Perfume Shelf

I designed PERFIS as a simple way to keep everyday things in one place, perfumes, skincare, small objects you actually use and want to see.

The shape is soft and structured at the same time. The arches give it a bit of character, but it still stays quiet and minimal. It doesn't try too hard, it just sits nicely wherever you put it.

No glue needed.

Just line up the pins, then push everything together slowly and evenly.
It should click into place and hold on its own.

TIP: Use silicone legs (up to 10 mm diameter) for better grip.

Materials I used

- BambuLab Marble PLA (shelves)
- BambuLab PLA Matte Latte Brown (side parts)

Size

120 × 239 × 243 mm
Minimum build plate: **250 × 250 mm**

Print Settings

- Layer height: **0.2 mm**
- Infill: **8–12% (gyroid)**
- Top layers: **6**
- Supports: **OFF**

Bed adhesion

This model can be a bit sensitive when printing, mainly the side pieces.

What worked for me:

- Wash the build plate with **detergent**
- Don't touch it after cleaning
- Use **glue / 3D lac** if needed

If the first layer isn't solid, it can fail, so it's worth taking a minute here.
