Answers

3) a) 3, 5, 6, 7, 9, 10

- b) Possible factors are: 64, 32, 16
- 4) Factors of 18:1, 2, 3, 6, 9, 18

1)

2) 120 and 2

Factors of 20: 1, 2, 4, 5, 10, 20

8 and 30

c) False. 8 only has four factors – 1, 8, 2 and 4.

40 and 60

a) True. All numbers are divisible by I and themselves and therefore would have a factor of I.

b) False. A factor is a number that multiplies with another number to create a product.

If a number is a multiple of another number, then it is also a factor.

40 and 60 are the odd ones out. They are a factor pair for the product 2400, while the others are all factor pairs for the product 240.

10 and 24

3) All the children are correct as these are all factor pairs for 24 and would create arrays with equal rows or columns.
