Living Things and Their Habitats:

Classifying Vertebrates

Aim:

To Explore and use classification keys to help group, Identify and name a variety of living things in their local and wider environment by generating questions to sort vertebrates in a classification key.

I can generate questions to use in a classification key.

Identifying differences, similarities or changes related to simple scientific ideas and processes by identifying vertebrates by their similarities and differences.

I can identify vertebrates by observing their similarities and differences.

Success Criteria:

I can generate questions about animals.

I can use questions to sort animals in a key.

I can see similarities and differences between vertebrates.

I can use these to identify vertebrate groups.

Key/New Words:

Variation, classification, vertebrates, invertebrates.

Resources:

Lesson Pack

Preparation:

Vertebrates Photo Sorting Cards - 1 per class

Vertebrates Activity Sheet - 1 per child Key Questions Activity Sheet - 1 per child

Prior Learning: Children will have sorted animals into a variety of groups in lesson 1.

Learning Sequence

Classification: Read the information on the **Lesson Presentation** to introduce children to the concept of classification, using the questions to prompt children to share any prior knowledge.

Animal Groups: Introduce the classifications of vertebrate and invertebrate, asking children to give examples of each. Explain that vertebrates can be further split into five groups: amphibians, birds, fish, mammals and reptiles. Explain the broad characteristics of each, asking children to note their similarities and differences. Distribute the cards from the **Vertebrates Photo Sorting Cards**, one per child. As a class, sort the cards into animal groups.

Vertebrates Activity Sheet: Children complete the **Vertebrates Activity Sheet** by answering the 'yes or no' questions to sort the vertebrates into animal groups.

Classification Keys: Introduce the idea of classification keys as a way of sorting animals into groups through a series of 'yes or no' questions. Children complete the differentiated **Key Questions Activity Sheet,** generating questions to sort vertebrates using a simple branching key.

Children generate four questions to sort vertebrates.

Children generate three questions to sort vertebrates.

Children generate two questions to sort vertebrates.

Whole Class

Twenty Questions: Split the class into two teams and choose a volunteer from one team to come to the front of the class. The volunteer choses an animal. The other team can ask the volunteer up to twenty questions about the animal but the volunteer can only answer with a 'yes or no'. If the other team are able to guess the animal within 20 questions, they win a point. If they cannot, the team of the volunteer win a point. The team with the most points after three rounds wins.

Taskit

Playit: Play this to learn more about the differences between the five groups of vertebrates.

Activityit: Practice identifying animal groups with this

Tableit: Complete a table with the characteristics of the vertebrate groups with this

Aim

- I can generate questions to use in a classification key.
- I can identify vertebrates by observing their similarities and differences.

Success Criteria

- I can generate questions about animals.
- I can use questions to sort animals in a key.
- I can see similarities and differences between vertebrates.
- I can use these to identify vertebrate groups.

Scientists think that there are 7.77 million species of animals in the world, living on the land, in the sky and in the sea.

We have discovered and named about 1.4 million of these...which means that over 6 million species of animal are yet to be discovered!

We have already discovered: **5500** species of mammal **10 400** species of bird

10 000 species of reptile

7300 species of amphibian

33 000 species of fish

1 305 000 kinds of invertebrate

Which kind of creature are we?

When scientists discover a new animal, they give it a name and record everything they know about it.

What kind of information do you think they will record?

Hadogenes troglodytes (Peters, 1861)

Common names:

Often known as South African rock scorpion or the flat rock scorpion.

Distribution:

Africa (Botswana, Mozambique, South Africa, Zimbabwe).

Habitat:

Lives in dry bushveld habitats in rocky areas.

Appearance:

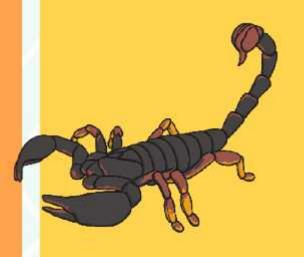

These scorpions have very elongated, flattened bodies and powerful claws.

Venom:

This species has a mild venom. It will rarely sting, and usually defends itself by using the powerful claws.

Latin name

Who discovered it and when

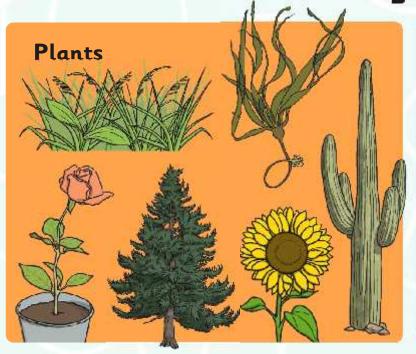

With so many living things to make records of, and so many yet to discover, it is important that we have a system to organise and make sense of the information we have about them.

We organise living things into groups based on their similarities and differences, so that we can learn more about what makes each species unique. The differences between living things is sometimes called **variation**.

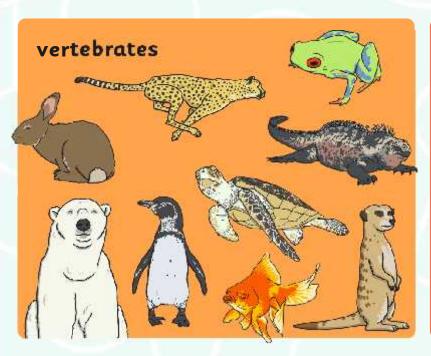

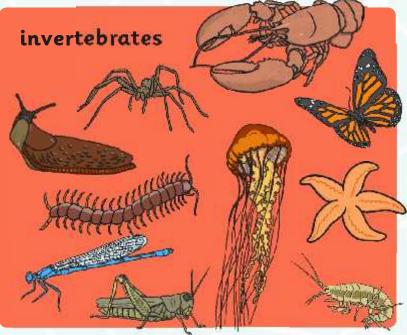

It is easy to sort most of the living things we can see in the world into two groups: plants and animals.

Plants and animals share life processes, but they do them very differently. Can you remember some of the differences between plants and animals?

Animal Groups

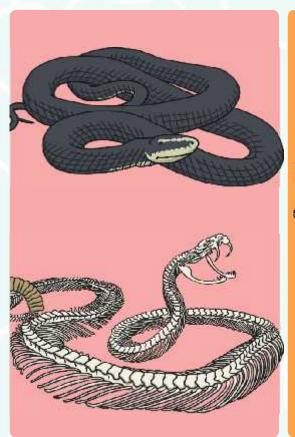

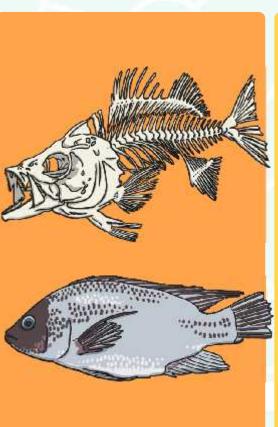

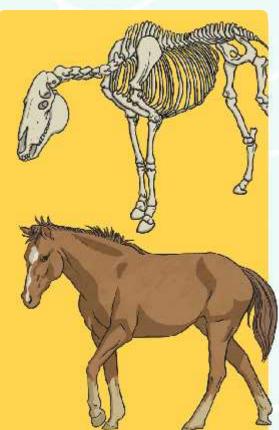

When looking at animals, scientists usually split them into two groups: **vertebrates** (animals **with** a backbone) and **invertebrates** (animals **without** a backbone).

Animal Groups: Vertebrates

Vertebrates are animals with a backbone. They have a hard skeleton made of bone. It holds their body up and gives them shape.

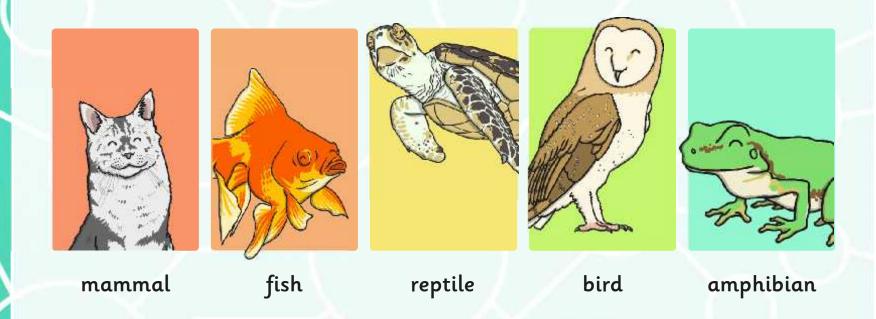

Animal Groups: Invertebrates

Invertebrates do not have a backbone, or a skeleton made of bones. Many have a hard shell outside their bodies to protect them. Others have soft, flexible bodies.

Animal Groups

Vertebrates can be separated into five broad groups:

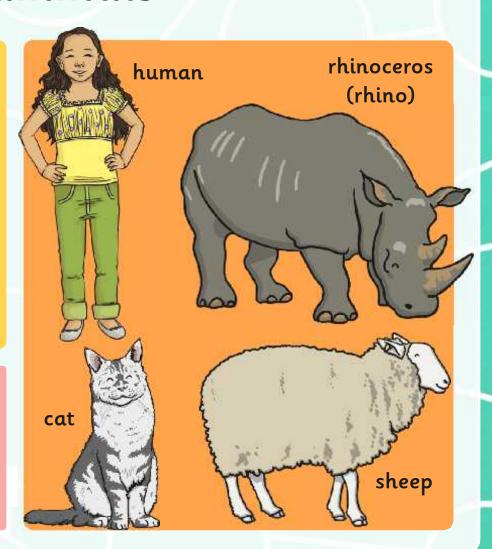

Mammals

Mammals have warm blood, and have hair or fur on their bodies.

Mammal babies are born alive.

The mothers feed their babies milk.

Amphibians

Amphibians live on land and in water.

They are cold-blooded.

They have gills when they are young.

They have smooth skin.

They lay their eggs in water.

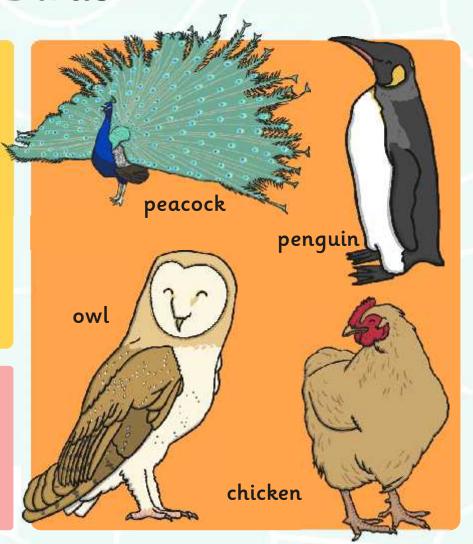

Birds

Birds have a beak, wings, feathers and 2 legs.

They lay eggs on land.

They have warm blood.

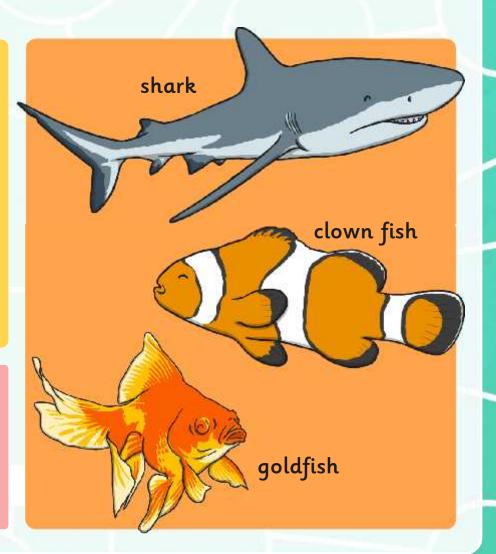

Fish

Fish live in water.

They have fins instead of legs and gills instead of lungs.

They lay their eggs in water.

They have cold blood and scaly skin.

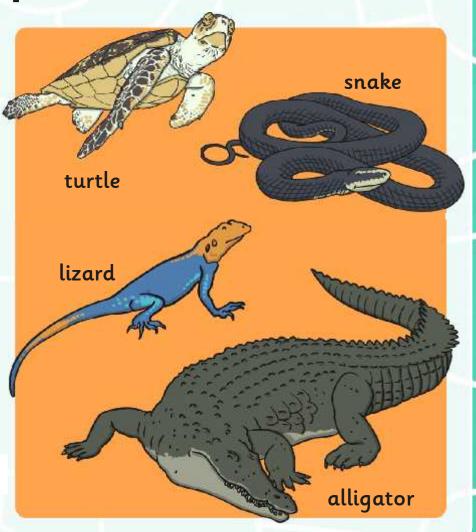

Reptiles

Some reptiles live on land, and some in water. They have lungs that breathe air.

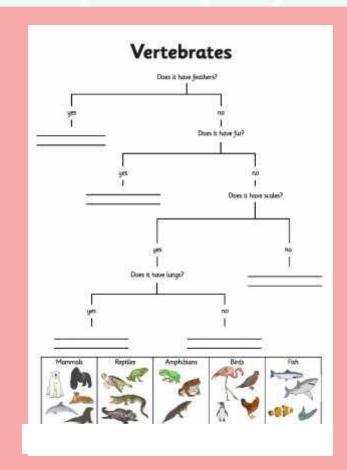

They have scales and are cold-blooded.

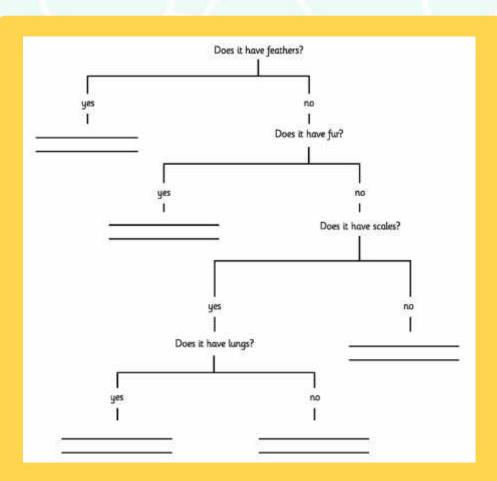

They lay their eggs on land.

Vertebrates Activity Sheet

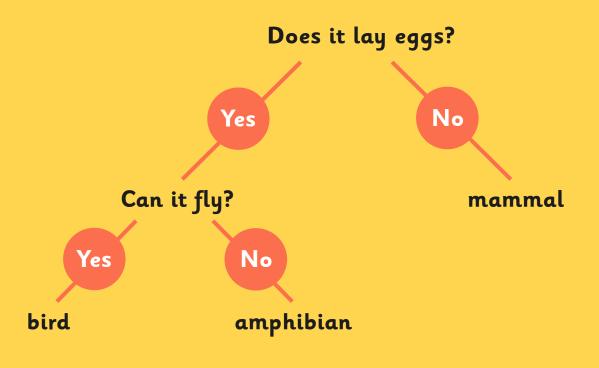

The activity you have just done uses a kind of classification key.

Classification keys are a way of identifying living things through a series of questions based on their similarities and differences.

For example: 'Does it lay eggs?'

Each question has a yes or no answer and leads you one step closer to the name of a living thing.

The questions start out very general at the beginning of the key as they help you sort the animals into broad groups.

Does it lay eggs?

Yes

No

mammal

Does it have a long, thin beak?

Yes

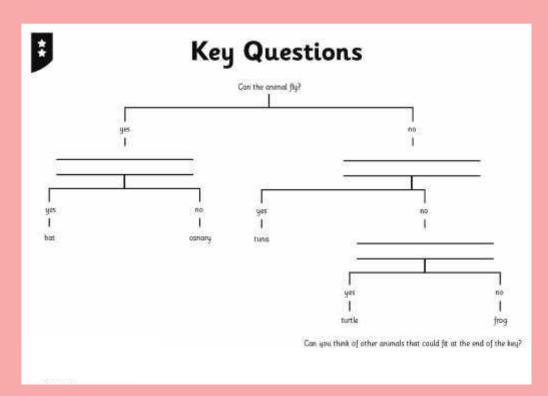

No

bird

Have a go at making up your own questions for a classification key.

Twenty Questions

- Split into two teams. Choose a volunteer from the first team.
- The volunteer chooses an animal.
- The other team can ask the volunteer up to twenty questions about the animal but the volunteer can only answer with a 'yes or no'.
- If the other team are able to guess the animal within 20 questions, they win a point.
- If they can't, the volunteer's team wins a point.
- Next, the other team chooses a volunteer.
- The team with the most points after three rounds wins.

Aim

- I can generate questions to use in a classification key.
- I can identify vertebrates by observing their similarities and differences.

Success Criteria

- I can generate questions about animals.
- I can use questions to sort animals in a key.
- I can see similarities and differences between vertebrates.
- I can use these to identify vertebrate groups.
