

The female lays a mass of eggs (frogspawn) which are fertilised by the male.

After 2 – 25 days, the tadpole hatches from the egg.

**The tadpole grows fins and a stronger tail.
Then, it develops lungs and hind legs.**

**The tadpole grows front legs and its tail shortens.
It jumps out of water on to land.**

**The tail starts to disappear.
It takes between two to four years for the
frog to become an adult and lay eggs.**
