

Extra Challenge

I can perform mental calculations with mixed operations.

For this part of the activity, you will need a set of playing cards.

For each question, choose a card from the deck and insert the card value in the star-shaped box; jacks, queens and kings have a value of 10 and aces have a value of 1 or 11. Complete the calculation and then think of a suitable question that would complete the number sentence.

$$\boxed{} = \star \times 25 + 35.6 - 5.06$$

$$\boxed{} = 50 \times (\star + 5.30 + 6.04 + 1.75)$$

$$3.6 \times \star \div 2 > \boxed{}$$

$$\star \div 4 + 7.059 + 9.495 < \boxed{}$$

$$3200 \times \star - 550 \neq \boxed{}$$
