

About Divorce AI

Divorce AI is an AI-powered divorce planning platform designed to help individuals understand the financial, practical, and emotional implications of divorce *before taking legal action—or even telling their spouse.*

Divorce is rarely impulsive. Most people spend months or years quietly considering their options, often without understanding what divorce would actually mean for their finances, children, or long-term stability. Yet the traditional divorce ecosystem offers little support at this early stage, focusing almost entirely on legal execution after decisions have already been made and conversations have already begun.

Divorce AI exists to change that.

Rather than filing paperwork or initiating divorce proceedings, Divorce AI operates **before lawyers, before courts, and before telling your spouse**, giving people a private way to explore outcomes, reduce uncertainty, and make informed decisions responsibly. The platform uses artificial intelligence to translate complex laws, financial variables, and family dynamics into clear, human-readable insights that anyone can understand—regardless of financial or legal knowledge.

Through a guided 15–20 minute intake, users receive **comprehensive, interconnected, and interactive reports** that together form a personalized financial blueprint of life after divorce. These insights cover critical areas such as child support, asset division, retirement accounts, post-divorce budgets, tax implications, debt allocation, healthcare, education planning, and long-term cash flow. The system adapts dynamically to each individual's situation, ensuring users see only what is relevant to them.

What makes Divorce AI fundamentally different is its ability to enable **private scenario planning**. Users can adjust assumptions—such as income changes, custody arrangements, or asset allocations—and instantly see how different decisions affect their overall financial picture. This real-time “what-if” exploration allows people to understand tradeoffs, avoid unnecessary conflict, and approach next steps with confidence rather than fear.

Privacy is foundational to everything Divorce AI builds. The platform is designed for discreet use, with features including app disguise, quick-exit gestures, PIN protection, secure document storage, and discreet billing. This allows individuals to plan quietly, at their own pace, *before involving their spouse, professionals, or courts*.

Divorce AI is not a replacement for legal or financial professionals. Instead, it ensures that when individuals choose to engage them, they do so informed, organized, and prepared—often saving time, money, and emotional strain in the process. As part of its broader mission, **Divorce AI also commits 1% of net profits annually to the Legal Services Corporation, supporting access to civil legal aid for low-income families nationwide.**

This approach has earned national recognition, including the **Forbes People's Choice Award**, reflecting growing acknowledgment that divorce preparation must start earlier, with better information and fewer assumptions.

By shifting divorce preparation from a reactive process to an informed one, Divorce AI is setting a new standard for how individuals can protect their finances, their families, and their future—*before* life-changing decisions or conversations take place.
