MOTHER & CHILD HEALTH HANDBOOK AFYA YA MAMA NA MTOTO

Name of Mother

۲

Name of Child

Contact Phone Number :

- Soma kitabu hiki upate mawaidha ya afya.
- Beba kitabu hiki kila mara uendapo kliniki na uonyeshe muhudumu wa afya.
- Read this handbook for important Health information.

Carry this handbook at all times during a visit to the health facility and show it to the health worker.

REVISED EDITION SEPTEMBER 2020

:

:

Dear Father and Mother!

Congratulations on this pregnancy! The Ministry of Health would like to celebrate with you and presents this Mother and Child Health (MCH) Handbook to you. Please read it well together with family members and understand the contents well. If you have any question, please ask a health worker or a Community Health Volunteer (CHV) without any hesitation.

Carry this Handbook every time you visit a health facility and show it to the health worker.

This MCH Handbook will be used during pregnancy, child birth and after child birth until the child is 5 years old. Please keep the Handbook safe and hand it over to the child when he/she is a young adult as a present with instructions to keep it safe. Your child will read its contents and understand his/her health history before birth until 5 years of age. The child will also realize your love, health workers' and other service providers' contribution towards protecting his/her life. We hope this MCH Handbook will help protect life of mother and child thus lead to; a healthy mother, child and family, and a healthy and prosperous Nation.

Birth Plan: Preparing for a safe and healthy childbirth;

Health worker to discuss with mother/couple and fill in:

•	Expected date of childbirth
•	Place of childbirth/Health facility name
•	Birth attendant
•	Health facility contact: phone number
•	Support person/birth companion
•	Transport
•	Blood donor
•	Financial plan for childbirth

Father's Support for Mother & Child Health

Father, you are very important for the health of the mother and child as well as your own health.

During pregnancy

Showing your wife /partner that you care about her can help her both physically and emotionally

- Ensure your wife/partner has support for the house chores.
- Ensure your wife/partner eats healthy foods at least 5 out of the 10 food groups everyday and goes for antenatal care, 8 times during the pregnancy. (See page 18)
- Accompany your wife/partner to the health facility as much as possible.
- Get tested and treated for Sexually Transmitted Infections (STIs) including HIV. If found
 positive you will receive appropriate advice on how to protect your unborn baby and your
 treatment.
- Ensure you and your wife/partner have a birth plan
- Be sure to play and communicate with your unborn baby during pregnancy
- · Discuss family planning method of choice with your wife/partner

During childbirth

You can help your wife/partner have a safe labour and childbirth:

- Ensure availability of basic needs in the house to avoid any worries as she goes to deliver at the health facility.
- Ensure transport to the health facility is available (Birth preparedness; money, birth companion, emergency kit)
- Ensure other children are taken care of.
- If you stay with her during the birth, you can help by giving her both emotional and physical support.
- Build her confidence by encouraging her by telling her she is doing well.
- Help her walk or squat during contractions or rub her back

After childbirth

- The first six weeks after birth are the most important for both mother and baby.
- Ensure the baby is given ONLY breast milk for the first 6 months for proper growth and disease prevention.
- Take time to hold and care for your baby to establish closeness (bonding) to your new child. This will also give your wife/partner a chance to sleep and rest. She needs a lot of healthy foods, fluids and plenty of rest during this time.
- If the mother is HIV positive the baby should get prophylaxis (nevirapine and AZT) during breastfeeding and a HIV test at 6 weeks of age. NB: A HIV positive couple can get a HIV negative baby.

Attend all your Antenatal clinic visits as advised by the health care provider **NOT FOR SALE**

Page 3 of 44

 \bigcirc

- Help her rest more by doing some of house chores or getting someone else who can help.
- Ensure the baby is exclusively breastfed (should not be given any foods, fluids and not even water) for 6 months after childbirth.
- Be sure to play and communicate with your baby.
- Avoid sexual contact until the bleeding and the discharge that comes after childbirth stops. (Usually 6 weeks after childbirth).
- Accompany your wife/partner to receive postnatal care.

Family Planning

- To have healthy mothers and babies it is best to space your children at least two years between pregnancies.
- You can help your family be healthy by using family planning, the mother can start an appropriate Family planning method immediately after childbirth.
- Visit the family planning clinic with your wife/partner and decide together which method will work best then share the responsibility for using it.

NB: Throughout pregnancy, childbirth and there after, be alert for danger signs in the mother and baby. If present seek medical help immediately. (See page14 and 19)

PREVENTIVE SERVICES							
Tetanus Diphtheria (TD) injection	Time given	Date given	Next visit				
1 st injection	First visit						
2 nd injection	4 weeks after 1 st dose but 2 weeks before childbirth						
3 rd injection	6 months after 2 nd dose						
4 th injection	1 year after 3 rd inj/ subsequent pregnancy						
5 th injection	1 year after 4 th inj/ subsequent pregnancy						

MALARIA PROPHYLAXIS

Timing of Contact	Dose#	Date given	Next visit						
1: Up to 12 weeks									
1a: 13 - 16 weeks	IPTp - SP dose 1								
2: 20 weeks	IPTp - SP dose 2								
3: 26 weeks	IPTp - SP dose 3								
4: 30 weeks	IPTp - SP dose 4								
5: 34 weeks	IPTp - SP dose 5								
6: 36 weeks	No SP, if last dose received <1 Month ago								
7: 38 weeks	IPTp - SP dose 6 (if no dose in past month)								
8: 40 weeks									
NB: IPTp give SP at 4 weeks intervals from 13 weeks gestation to term in malaria endemic areas									
Long lasting Insecticion	de Treated Net (LLITN)								

Deworming (Mebendazole 500mgs) given once in the 2nd trimester date given

IRON AND FOLIC ACID SUPPLEMENTATION (IFAS) 270 tablets; Dosage - 1 tablet per day: Taken with meals

Elemental Iron	Contacts	Gestation in weeks	No. of Tablets	Date Given
		Upto 12weeks	60	
	1	12 weeks	56	
(Combined Tablets	2	20 weeks	42	
60mg Iron and 400µg	3	26 weeks	28	
Folic acid)	4	30 weeks	28	
Or any other equivalent	5	34 weeks	14	
available	6	36 weeks	14	
	7	38 weeks	14	
	8	40 weeks	14	

N/B The first 4 weeks are especially critical to the unborn baby in prevention of Neural Tube Defects (birth defects of the brain, spine or spinal cord; the most common ones are spina bifida and anencephaly). Take IFAS as per the health worker's advise to prevent these defects.

NOTE: • IFAS should be taken from conception to delivery and thereafter if some tablets have remained. • At every visit, give doses that will last until the next visit.

Mother Child Health Handbook MOH - NEW 7th Dec 2020.indd 10

Tetanus Diphtheria (TD) Vaccination:

- If a pregnant woman has not been previously vaccinated, or her immunization status is unknown, she should receive two doses of tetanus diphtheria vaccine one month apart with the 2nd dose given at least 2 weeks before childbirth. 2 doses protect against tetanus infection for 1-3 years.
- A 3rd dose is recommended six months after the second dose, which should extend protection to at least 5 years.
- Two further doses for women who are first vaccinated against tetanus during pregnancy should be given after the 3rd dose, in the two subsequent years or during two subsequent pregnancies.
- If a woman has had 1-4 TD injections in the past, she should receive one dose of TD during each subsequent pregnancy to a total of 5 doses
- 5 doses protect throughout the childbearing years.

Only when the interval between the 1st and 2nd pregnancy is greater than (or equal to) 10yrs, should the schedule be re-started from T.D.-1.

(This rule does not apply to intervals greater than 10yrs between the 2nd-3rd pregnancies or the 3rd-4th pregnancies. Meaning that a long delay between T.D.2 & T.D. 3 is more risky than a long delay between T.D.3 & T.D4 or between T.D.4 & T.D.5)

Viral load (VL) sample	Date Viral load taken	Date Viral load taken	Date Viral load taken	Date Viral load taken	All should have a viral load. Refer to current ART guidelines for viral load monitoring.
	Results	Results	Results	Results	loud monitoling.

NOTE: Assess all HEIs for initiation of ARV prophylaxis immediately after childbirth or at first contact after birth.

Give the mother the ART prophylaxis to give to the baby immediately after birth and continue until 6 weeks after complete cessation of breastfeeding. (See page 36)

CTX Prophylaxis syrup is to be issued from 6 weeks after birth (See page 20) for post-natal assessment; and (See page 36) for ART&CTX prophylaxis)

COUNSEL MOTHER ON MANAGEMENT OF THE HEI (See page 36) for HEI prophylaxis or ART treatment.

DENTAL HEALTH FOR YOU AND YOUR BABY

Your baby's teeth are important for chewing, speaking and to guide the growth of the face and jaws in readiness for permanent set of teeth later in life. Baby teeth start to develop during week 6 of pregnancy. At birth, your baby will have small swellings in the mouth marking the areas of teeth inside the gum. The swellings are your baby's developing teeth, they are not 'false" or "plastic" teeth. The first baby teeth may come in when baby is 4-12 months old. During this time when teeth are coming in, the gums may be itchy, and your baby may show signs of increased salivation. This is normal and does not need the use of "teething gels" or "teething powders". Dentists/ oral health officer do not recommend their use as some may affect your baby.

Some babies may be born with one or more teeth in the mouth. These are called "Neonatal teeth". If they cause pain to the mother during breast feeding, take your baby to the dentist so that they can be safely removed.

Cleaning your baby's teeth

Prevent tooth decay by brushing baby teeth twice a day, (after morning feed and at night before going to sleep), avoiding sugary foods and drinks, and not putting babies to sleep with bottles. Clean baby teeth with a designated soft wet cloth or a soft baby-tooth brush. Start cleaning baby's teeth as soon as they appear.

2 to 5 years

Rice-grain-sized Smear for age less than 2 years

Pea- size for age

Regular for age more than 5 years

- · Cavity-preventing fluoride toothpaste starting with baby's very first tooth is recommended.
- Use a rice-grain-sized smear of toothpaste for your baby or toddler age less than 2 years, graduating to a pea-sized by age 2 to 5years, just like in the image on the left, so that even when the baby swallows, the amount is insignificant.

Attend all your Antenatal clinic visits as advised by the health care provider **NOT FOR SALE**

- You need to assist your baby with teeth brushing until they reach the age of 6-8 years (Until you see they can tie their shoe-laces).
- Baby's teeth do not cause diarrhoea, but the gums may be itchy and baby may put things like dirty toys around them into the mouth causing stomach upsets. Ensure they have clean toys and teething rings to soothe the gums during this time.
- Feed baby on healthy foods and snacks; avoid sweetened juices, sweets, chocolates.
- Take your baby to the dentist at the age of 1 year. The dentist will review baby's progress and give you more advice on the care of your baby's teeth.

Dental care for pregnant mothers

Brush your teeth thoroughly twice a day (after breakfast and before bed) with fluoridated toothpaste. If you feel like vomiting when you brush your teeth, try brushing about one hour after your last meal. Visit your dentist/oral health officer to discuss other tooth-cleaning methods that may work for you, if your gums bleed during tooth brushing or if you have any other problem with your teeth as this may get worse when you are pregnant.

Get your teeth checked when you plan for a pregnancy to ensure you have good teeth to eat well and keep your body healthy for the healthy development of your baby.

Dental treatment can be carried out during pregnancy without causing any harm to your baby. You will just need to inform your dentist, so they can take the necessary care during your treatment.

During pregnancy, some mothers get the urge to eat more sugary snacks. This practice can increase the occurrence of tooth decay and it is best to avoid.

Lost teeth due to dental problems or for any other reason can be replaced at a dental clinic.

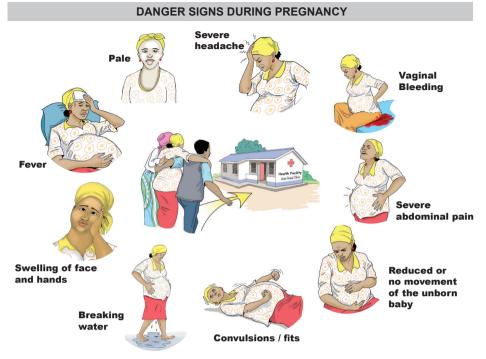

CARE DURING PREGNANCY

- Eat one extra meal every day during pregnancy
- Eat at least 5 of the 10 food groups everyday
- Drink plenty of water at least 8 glasses per day(2 litres)
- Take iron and folic acid supplements (IFAS) everyday throughout pregnancy
- · Avoid heavy work, rest more
- Sleep under an long lasting insecticidal net (LLIN)
- Go for ANC visit as soon as possible and attend 8 times during the pregnancy
- Do regular non-strenuous exercises

POSITIONING AND ATTACHMENT FOR BREASTFEEDING

Is the infant correctly positioned? Positioning refers to when:

- 1. Baby's head and body is straight
- 2. Baby facing the mother with the nose opposite the nipple
- 3. Baby's body close to the mother's body (Infant's Tummy to mother's tummy)
- 4. Mother supporting infant's whole body and not just neck and shoulders.

All the 4 signs of correct positioning must be present to decide there is correct positioning

Is the infant correctly positioned?

Yes 🗌 No 🗌

How to attach:

- 1. Touch the baby's upper lip with your nipple
- 2. Wait until the baby's mouth is open wide
- Move the baby quickly onto your breast, aiming the baby's lower lip well below the nipple

Is the infant able to attach? To check for attachment look for:

- 1. Chin touching the breast
- 2. Mouth wide open
- 3. Lower lip turned outward
- 4. More areola seen above than below the mouth

All the 4 signs of good attachment must be present for one to decide that there is good attachment

Is the infant well attached to the breast?

Yes 🗌 No 🗌

Signs of effective suckling:

- 1. Slow deep sucks, sometimes pausing
- 2. Cheeks round when suckling
- Baby releases breast when milk is finished or he/she is satisfied
- 4. Mother feels relaxed

NB: During breastfeeding, show the mother correct positioning and good attachment.If breast milk is not enough, immediately visit a health facility.

HEALTHY EATING DURING PREGNANCY AND BREASTFEEDING:

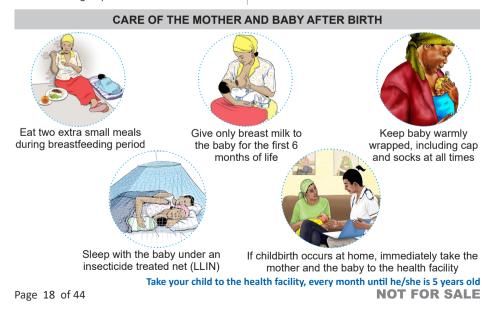

food groups and a few examples of each.

Variety is key

 (\bullet)

- Eat at least 5 of the10 food groups each dav.
- Eat a variety of foods within each food group and of different colours across all the food groups.
- Consume plenty of safe water throughout the day.
- Take one extra meal per day
- Take lots of nutritious fluids (Porridge, soup, fresh fruit juice).

(�)

fruits and vegetables

Note: In case of any of these danger signs, immediately visit a health facility

SECTION 2: CHILD HEALTH MONITORING

4

A. Particulars of the Child:

Date first seen (DD/MM/YY) /

 Name of Child:

 Sex of child:

 Date of birth – (DD/MM/YY) / / _/____

 Gestation at birth (in weeks)..... Birth weight (gms)...... Birth Length (cm)......

 Other birth characteristics**

 Birth order in family (e.g. 1st, 2nd, 3rd born):

 Date 1st seen (DD/MM/YY) / / /

B. Health Record of Child:

Place of birth:	
Health facility: Home: Other (Specify)	
Birth Notification No.:	_ Date:
Immunization permanent register No.	
Child Welfare Clinic (CWC) No.	
Health facility name:	
Master facility list (KMHFL) Code:	

C. Civil Registration:

Birth Certificate No.:
Date of registration:
Place of registration:

**e.g. twin/triplet; caesarian birth; congenital features. Any congenital abnormalities (cleft lip, club foot).. etc _

D. Civil Registration:

Father's name:	Tel No.
Mother's name:	Tel No.
Guardian's name (where applicable):	Tel No.
Residence of child:	County:
Division:	Sub County:
Town/Trading centre/ Ward:	
Estate & House No./Village:	
Postal address:	

(�)

Take your child to the health facility, every month until he/she is 5 years old **NOT FOR SALE**

E. Broad clinical review at first contact below 6 months:

Age at first contact:			
Weight (gms):			
Length/height (cm):			
Z score (Refer to the growth charts (See page	s 27 to 30))		
HIV status: Exposed: Date: Reactive: Non reactive: Date: Unknown: If unknown conduct HIV test (See page 36) Refer to current ART guideline.			
Haemoglobin (HB)			
Physical features:			
Colouration (cyanosis/jaundice/macules/hypop	igmentation):		
Head circumference (cm):	Eyes (refer to section I):		
Ears:	Mouth:		
Chest:	Heart:		
Abdomen:	Umbilical cord/umbilicus:		
Spine: Arms & hands:			
Legs & feet:			
Genitalia Normal: Abnormal: (Specify: Indeterminate, undescended testes/ hypospadiasis etc)			
Anus: Perforate (Normal) Imperforate (Abnormal)			
TB: Screen baby for TB as per the TB ICF card	d		

F. Feeding information from parent/guardian

Breastfeeding: Well: Poorly: Unable to breastfeed:
Other feeds introduced below 6 months: Yes: No: If yes, at what age Counsel on exclusive breastfeeding
Complementary food from 6 months: Other foods introduced: Yes No
*Retention of feeds/indigestion:
*NB: A baby who is exclusively breastfed may pass stool many times or may not pass any for some days. This is normal unless he/she has abdominal distension or is vomiting.

G. Other problems as reported by parent/guardian

Does the baby have problems sleeping?:		
Irritability:	Yes 🗌 No 🗌	
Others specify:		

Refer for further management as appropriate.

Take your child to the health facility, every month until he/she is 5 years old **NOT FOR SALE**

MOTHER & CHILD HEALTH HANDBOOK - 2020

H. Developmental Milestones

	Milestones	Age Achieved	Normal Limits	Within time	Delayed
	Social smile/follows a colourful object dangled before their eyes		0 - 2 months		
	Holds the head upright / follows the object or face with their eyes / turns the head or responds in any other way to sound / smiles when you speak		2 - 4 months		
2	Rolls over / reaches for and grasps objects with hand / takes objects to her mouth / babbles (makes sounds)		4 - 6 months		
	Sits without support / moves object from one hand to the other/ repeats syllables (bababa, mamama)		6 - 9 months		
	Takes steps with support / picks up small object or string with 2 fingers / says 2-3 words / imitates simple gestures (claps hands, bye)		9 - 12 months		
(Where is your) nose?	Walks without support / drinks from a cup / says 7-10 words / points to some body parts on request		12-18 months		
Nice Chicken	Kicks a ball / builds tower with 3 blocks or small boxes / points at pictures on request / speaks in short sentences		18 - 24 months		
	Jumps/ undresses and dresses themselves / says name, tells short story/ interested in playing with other children		24 months and older		
	Refer for further assessment if a milestone	e delays beyo	ond the norma	l age limit a	as indicat-

•

Refer for further assessment if a milestone delays beyond the normal age limit as indicated above

I. Identification of early eye problems in an infant

EYE CARE ASSESSMENT (Tick on the appropriate unshaded boxes for age)		AGE IN MONTHS			
		At Birth	At 6 months	At 9 months	At 18 months
TETRACYCLINE EYE OINTMENT (TEO) GIVEN	TEO (ONLY at Birth)				
PUPIL	Black				
	White (If white refer urgently)				
SIGHT	Following objects				
	Not following objects (<i>Refer to eye clinic</i>)				
SQUINT (Crossed eyes)	Squint (<i>Refer to eye clinic</i>)				
	No Squint				
ANY other Problem	Yes (<i>Refer to eye clinic</i>)				
NB: Some eve problems in child	No				

NB: Some eye problems in children apart from causing visual impairment or blindness could also cause death of the child. Early identification and treatment for the problem is critical. Preterm infants on oxygen to have Retinopathy of Prematurity (ROP) examination.

J. Record of baby's teeth development

It should be fun for your baby to know when they got their teeth. Here is a chart for you to keep this record.

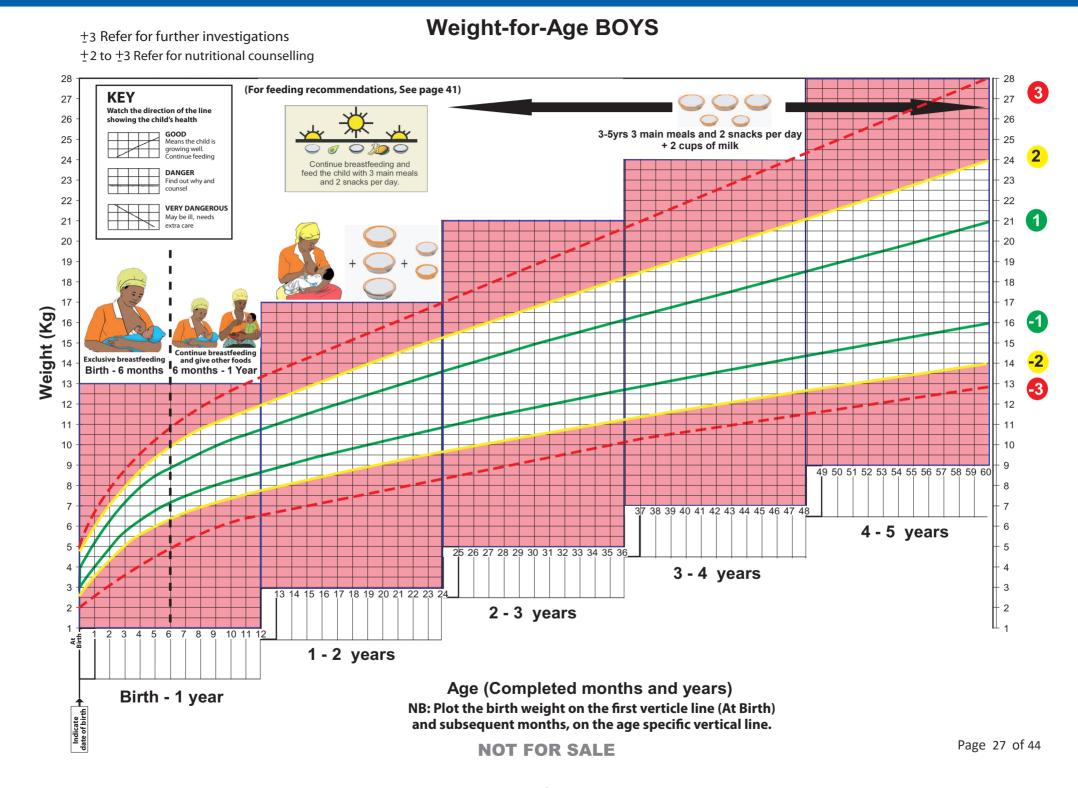

Observation	Normal limits	Age of baby when tooth seen	Date seen
Lower Incisor	4-10 months		
Upper Incisor	6-12 months		
Lower Canine	12-23		
Upper Canine	12-23		
Lower First Molar	12-18		
Upper First Molar	12-18		
Lower Second Molar	24-30		
Upper Second Molar	24-30		

Reason for Special Care (Tick as appropriate)

 Birth weight less than 2.5kg 	
Birth less than 2 years after last birth	
Birth order (Fifth child or more)	
Born of a teenage mother	
Born of a mentally ill mother	
Child with developmental delays	
Any of the child's siblings been undernourished	
Multiple births (Twins, Triplets)	
Children with special needs	
 Orphans and vulnerable children 	
Child has disability	
 HIV Exposed Infants (HEI) 	
 History/signs of child abuse/neglect 	
• Cleft lip/palate	
 Any other(specify) 	

IF YOU HAVE TICKED ANY OF THE ABOVE: COUNSEL THE CAREGIVER AND/OR REFER FOR FURTHER MANAGEMENT

IDENTIFICATION OF EXPOSED CHILDREN AT FIRST CONTACT AFTER DELIVERY, OR AT **6 WEEKS OR FIRST CONTACT AFTER 6 WEEKS**

Establish HIV Exposure Status of all infants at first contact:

To establish if the infant is exposed conduct a maternal antibody test. If the mother serology is reactive the baby is Exposed (HEI).

For an infant accompanied by a guardian and with unknown maternal HIV status, conduct HIV antibody test to establish if the infant is HIV exposed.

If the infant is exposed (HEI); Collect a DBS for DNA PCR at first contact after delivery or at 6 weeks. or first contact after 6 weeks.

All HEIs should be tested as per the table below;

Type of Test	Date of Sample Collection	Results
1 st DNA PCR 1st contact after delivery or at 6 weeks, or first contact after 6 weeks.		
If 1 st PCR test positive, collect a confirmatory DNA PCR and baseline viral load, and start on ARV		
2 nd DNA PCR at 6 months		
3 rd DNA PCR at 12 months		
Antibody test at 18 months		
If breast feeding, conduct HIV antibody test at 24 months (Repeat the HIV antibody test every 6 months until complete cessation of breastfeeding)		
Final antibody test 6 weeks after complete cessation of breastfeeding		

DNA PCR-DNA polymerase chain reaction · DBS-Dried blood spot Key: •

Note: Encourage exclusive breastfeeding for all infants including HEI.

HIV Exposed Infant	HIV Exposed Infant					
ARV Prophylaxis: AZT+NVP for 6 weeks (Dose to be adjusted as per the infant weight/Age)	Start at birth- give to mother at first contact Continue NVP for minimum 12 weeks if not breastfeeding. If breastfeeding, continue NVP until 6 weeks after complete cessation of breastfeeding. Stop NVP syrup immediately if infant turns HIV positive and start ART.					
CTX Prophylaxis: CTX syrup 2.5 MI OD (Dose to be adjusted as per the infant weight/Age)	Start at 6 weeks after birth or at first contact after 6 weeks. Continue until 6 weeks after complete cessation of breastfeeding.					
Infant IPT syrup	Given as per Infant's eligibility.					

HIV Inf	ected	Infant	
---------	-------	--------	--

ART for life. (Dose to be adjusted as per the infant weight/Age)	Stop NVP syrup immediately and start appropriate ART regimen if infant turns HIV positive. Refer to current ART guideline for HAART regimen.
CTX syrup 2.5 MI OD. (Dose to be adjusted as per the infant weight/Age)	Start at 6 weeks after birth or at first contact after 6 weeks. Adjust dose as per weight.
IPT syrup	Given as per child's eligibility.

PREVENTION OF MOTHER TO CHILD TRANSMISSION (PMTCT) OF HIV/SYPHILIS AND HEPATITIS B

HIV

Your baby is HIV exposed because you are HIV positive. It is important that you exclusively breastfeed your baby. For positioning and attachment for breastfeeding (See pages 16). Continue taking baby to the health facility for immunization, Vitamin A /Micronutrients supplementation/ deworming, Antiretroviral and septrin medicines as their growth is monitored every month till they become 5 years of age.

Syphilis

What is syphilis? Syphilis is an infection that can be contracted through unprotected sex. If a pregnant mother gets infected with Syphilis and she is not treated adequately, she can suffer a miscarriage or give birth to a premature or dead baby or deliver a baby with a very low birth weight or a baby already infected with Syphilis. The baby born of a mother who has Syphilis can die within four months of life. Syphilis can be passed on from mother to the baby during the process of childbirth.

What are the symptoms of syphilis?

Symptoms start 2 to 3 weeks after sexual contact with an infected person. It starts with a painless sore on the penis, vagina, anus, or mouth.

These ulcers mostly heal on their own within a few weeks. Since they don't hurt, many people don't get treatment for them. Then there are no symptoms until later in life where the disease will result in damaged brain, nerves, eyes or heart.

How can I test for syphilis?

Testing is done for all pregnant mothers alongside HIV testing [Dual testing] at the Antenatal Clinic. If your test is positive, your partner should also be tested and treated if he is found to be positive.

Is there treatment for syphilis?

Yes, if you test positive for Syphilis, your healthcare provider will start you on appropriate medicines to stop risk of transmitting to your baby.

How can I prevent getting infected by syphilis?

- Being faithful to your sexual partner and vice versa.
- Avoiding sex when you or your partner has any symptoms that could be caused by Syphilis infection
- Using a condom every time you have sex

Hepatitis B

- Hepatitis B is a serious liver infection caused by the hepatitis B virus. The virus is passed from one person to another through unprotected sex with an infected partner or sharing needles with an infected person or from an infected mother to her baby during delivery.
- Many people do not know that they are carrying the virus, as they can have it for years before developing symptoms. A person or mother infected with Hepatitis B, can eventually develop liver disease which has no cure. It can also lead to early death of the child from liver cancer, cirrhosis or liver failure.
- It is important for every pregnant woman to know their hepatitis B status in order to prevent passing the virus to their unborn baby during delivery (See page 7).

Counsel the caregiver on feeding recommendations FOR ALL CHILDREN during health and sickness

BREASTFEEDING

	Newborn upto 1 week	• Immediately after birth, put the baby on skin-to-skin contact with the mother for at least one hour.
		 Initiate breastfeeding within the first hour after birth. Give your baby colostrum (the first yellowish, clear, whitish milk). It protects the baby from many illnesses.
		 Breastfeed on demand (day and night, as often as the baby wants) at least 8 times in 24 hours. Frequent feeding produces more milk.
		 If the baby is small (low birth weight - <2500g), feed at least every 2 to 3 hours. Wake the baby for feeding after 3 hours, if baby does not wake self.
		DO NOT give other foods. Breast milk is all your baby needs.
	1 WEEK UP TO 6 MONTHS	 Breastfeed as often as the child wants. Look for signs of hunger, (fuss, sucking/moving lips, opening mouth, making sounds, sticking out the tongue, putting hands in his mouth, making rapid eye movement before his/her eyes are open, baby may cry)
		 Breastfeed on demand (day and night, as often as the baby wants) at least 8 times in 24 hours. Frequent feeding produces more milk.
		• Breast milk is all your baby needs.
		DO NOT give other foods or fluids

COMPLEMENTARY FEEDING

	Age	Texture	Frequency	Amount of food per meal
	At 6 months	Start with thick porridge or well mashed/ pureed foods.	Frequent breast feeds Feed your child 2 times (2 meals)	2 table spoon each feed, increase to 3 table spoons in the 3rd to 4th week. Add MNPs
	7-8 months	Mashed family foods, by 8 months your baby can begin eating finger food.	Frequent breast feeds Feed your child 3 times (3 meals)	Increase amount gradually to half (½) cup (250ml cup). Add MNPs
	9-11 months	Finely chopped or mashed foods, introduce foods that baby can pick with their fingers.	Frequent breast feeds Feed your child 4 times (3 meals,1 snack)	3/4 of a cup/bowl (250 ml) Add (MNPs)

FLUIDS

FOR ANY SICK CHILD

- Breastfeed frequently and for longer at each feed
- Increase fluid. Give soup, rice water, yoghurt drinks or clean and safe water, if not on exclusive breastfeeding.

CHILD WITH DIARRHOEA Giving more fluids can be life saving

1) For children not on exclusive

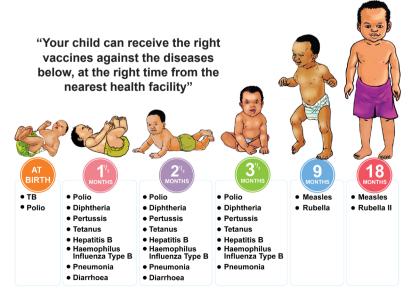

breastfeeding:

Give extra fluids as much as the child will take:

- · ORS solution
 - Food based fluids such as
 - Soup
 - Rice
 - Yoghurt drink
- Clean and safe water
- Breastfeed more frequently and longer at each feeding
- Continue giving extra fluids until diarrhoea stops
- 2) For babies on exclusive breastfeeding:
- Breastfeed more frequently and longer at each breastfeed
- Give ORS solutions
- 3) Give zinc as advised by health worker until it is finished.

If the child vomits, wait for 10 minutes then give small frequent sips.

Immunisation Summary/Certificate

Attend all your Antenatal clinic visits as advised by the health care provider NOT FOR SALE

•

Dear young adult

Your information is written in this MCH Handbook. When you get this Handbook from your parents, look through from cover page to the end carefully. The cover is tired, perhaps because your parents brought it many times to the health facility during routine health monitoring and sickness. They also made use of the information in the Handbook and studied how to take care of you. From the information in this Handbook you can know how you were born and grew up till you were five years old. It can also help you know how to take care of your health, be a healthy citizen and build a healthy nation.

Please keep this handbook safe, handle it carefully. When your child will grow up, please show them this MCH Handbook and give them their own handbooks as presents from parents.

Parents' sweet messages at each juncture, at:

Confirmation of pregnancy
Child at age 4 months
Child at age 6 months
Child at age 1 year
Child at age 2 years
Child at age 3 years
Child at age 4 years
Child at age 5 years
