Next Webinar:

New Combination Vaccines

July 30, 2024

Our ability to develop novel vaccines is now outpacing our practical ability to integrate them into the increasingly crowded vaccine schedule. Combination vaccines that protect against multiple diseases may be the best—and possibly only—pathway forward.

But historically the value of a vaccine has mainly been a function of its ability to reduce disability and deaths from a specified pathogen. This construct may be less useful in estimating the value of combinations, particularly those formed by merging existing licensed in-use vaccines, where the benefits center on operational efficiencies.

This webinar will:

- Highlight the increasingly urgent need for combination vaccines
- Explore recent innovations that could help us surmount some of the formulation and delivery challenges inherent in these products
- Explore challenges in how we estimate the total “vaccine value proposition” for future combinations
- Consider the benefits that may result if we are successful
