Introduction

Introduction to SCOR

Summary

The Supply Chain Operations Reference model (SCOR®) is the product of Supply Chain Council, Inc. (SCC) a global non-profit consortium whose methodology, diagnostic and benchmarking tools help organizations make dramatic and rapid improvements in supply chain processes. SCC established the SCOR process reference model for evaluating and comparing supply chain activities and performance. The SCOR-model captures SCC's consensus view of supply chain management. It provides a unique framework that links business process, metrics, best practices and technology into a unified structure to support communication among supply chain partners and to improve the effectiveness of supply chain management and related supply chain improvement activities. SCC membership is open to all companies and organizations interested in applying and advancing the state-of-the-art in supply chain management systems and practices.

SCC was organized in 1996 and initially included 69 practitioner companies meeting in an informal consortium. Subsequently, the companies of SCC elected to form an independent not for profit trade association. The majority of the SCC's members are practitioners and represent a broad cross-section of industries, including manufacturers, distributors, and retailers. Equally important to SCC and the advancement of the SCOR-model are the technology suppliers and implementers, academics, and government organizations that participate in SCC activities and the development and maintenance of the model.

Supply Chain Council is interested in providing the widest possible dissemination of the SCOR-model. The wide-spread use of the model results in better customer-supplier relationships, software systems that better support members through the use of common measurements and terms, and the ability to rapidly recognize and adopt practices no matter where they originate. SCC requests that all who use the SCOR-model provide attribution to Supply Chain Council. Additionally, members are encouraged to monitor the members section of the SCC website (www.supply-chain.org) to ensure that they are using the latest version of SCOR.

This introduction is provided to assist new users of the SCOR-model to begin launch the adoption adaptation of the SCOR-model in their companies. It is intended to remind experienced users of the framework and structure of the model when tackling more complex applications of the model for their businesses. Finally, it is provided to orient members to the changes between version 10.0 and version 11.0.

Version 11.0 of the SCOR-model is the thirteenth revision since the model's introduction in 1996. Revisions of the model are made when it is determined by SCC members that changes should be made to facilitate the use of the model in practice. Specific changes in Version 11.0 are outlined later in this Introduction.

Scope of SCOR

The SCOR-model has been developed to describe the business activities associated with all phases of satisfying a customer's demand. The model itself contains several sections and is organized around the six primary management processes of Plan, Source, Make, Deliver, Return and Enable (shown in Figure 1). By describing supply chains using these process building blocks, the model can be used to describe supply chains that are very simple or very complex using a common set of definitions. As a result, disparate industries can be linked to describe the depth and breadth of virtually any supply chain. The model has been able to successfully describe and provide a basis for supply chain improvement for global projects as well as site-specific projects.

Figure 1 - SCOR is organized around six major management processes

It spans: all customer interactions (order entry through paid invoice), all physical material transactions (supplier's supplier to customer's customer, including equipment, supplies, spare parts, bulk product, software, etc.) and all market interactions (from the understanding of aggregate demand to the fulfillment of each order). It does not attempt to describe every business process or activity. Specifically, the model does not address: sales and marketing (demand generation), product development, research and development, and some elements of post-delivery customer support.

It should be noted that the scope of the model has changed and is anticipated to change based on Council member requirements. With the introduction of Return, the model was extended into the area of post-delivery customer support (although it does not include all activities in that area).

As shown in Figure 2, the model is designed to support supply chain analysis at multiple levels. SCC has focused on the top three process levels, which are industry neutral. SCOR does not attempt to prescribe how a particular organization should conduct its business or tailor its systems/information flow. Every organization that implements supply chain improvements using the SCOR-model will need to extend the model, at least to Level-4, using industry-, organization- and/or location-specific processes, systems, and practices.

		Level		Examples	Comments
		#	Description		
Within scope of SCOR	↑	1	 Process Types (Scope)	Plan, Source, Make, Deliver, Return and Enable	Level-1 defines scope and content of a supply chain. At level-1 the basis-of-competition performance targets for a supply chain are set.
		2	 Process Categories (Configuration)	Make-to-Stock, Make-to-Order, Engineer-to-Order Defective Products, MRO Products, Excess Products	Level-2 defines the operations strategy. At level-2 the process capabilities for a supply chain are set. (Make-to-Stock, Make-to-Order)
		3	 Process Elements (Steps)	<ul style="list-style-type: none"> Schedule Deliveries Receive Product Verify Product Transfer Product Authorize Payment 	Level-3 defines the configuration of individual processes. At level-3 the ability to execute is set. At level-3 the focus is on the right: <ul style="list-style-type: none"> Processes Inputs and Outputs Process performance Practices Technology capabilities Skills of staff
Not in scope	↓	4	 Activities (Implementation)	Industry-, company-, location- and/or technology specific steps	Level-4 describes the activities performed within the supply chain. Companies implement industry-, company-, and/or location-specific processes and practices to achieve required performance

Figure 2 - SCOR is a hierarchical process model

It is important to note that this model describes processes not functions. In other words, the model focuses on the activity involved not the person or organizational element that performs the activity.

SCOR Structure

SCOR is a reference model. The purpose of a process reference model, or business process framework, is to describe your process architecture in a way that makes sense to key business partners. Architecture here means the way processes interact, how they perform, how they are configured and the requirements (skills) on staff operating the process.

The SCOR reference model consists of 4 major sections:

- Performance: Standard metrics to describe process performance and define strategic goals
- Processes: Standard descriptions of management processes and process relationships
- Practices: Management practices that produce significant better process performance
- People: Standard definitions for skills required to perform supply chain processes.

The SCOR reference also contains a section for special applications. Section 5, Special Applications is used for suggested SCOR additions that have not yet been tested thoroughly for integration into the model, but that SCC believes would be beneficial for SCOR users.

Performance

The performance section of SCOR consists of two types of elements: Performance Attributes and Metrics. A performance attribute is a grouping of metrics used to express a strategy. An attribute itself cannot be measured; it is used to set strategic direction. Examples of business strategies applied to supply chain are: 'Superior performance for Supply Chain Reliability' or 'Advanced performance for Agility'. Metrics measure the ability of a supply chain to achieve these strategic attributes. Superior performance for Reliability can thus be expressed in a performance objective: Perfect Order Fulfillment: X%. Reliability is the performance attribute, Perfect Order Fulfillment is the metric. Benchmarking is a commonly used method to calculate the value of X in the Reliability example.

Performance Attribute	Definition
Reliability	The ability to perform tasks as expected. Reliability focuses on the predictability of the outcome of a process. Typical metrics for the reliability attribute include: On-time, the right quantity, the right quality.
Responsiveness	The speed at which tasks are performed. The speed at which a supply chain provides products to the customer. Examples include cycle-time metrics.
Agility	The ability to respond to external influences, the ability to respond to marketplace changes to gain or maintain competitive advantage. SCOR Agility metrics include Flexibility and Adaptability
Costs	The cost of operating the supply chain processes. This includes labor costs, material costs, management and transportation costs. A typical cost metric is Cost of Goods Sold.
Asset Management Efficiency (Assets)	The ability to efficiently utilize assets. Asset management strategies in a supply chain include inventory reduction and in-sourcing vs. outsourcing. Metrics include: Inventory days of supply and capacity utilization.

Table 1 - The SCOR Performance Attributes

Reliability, Responsiveness and Agility are considered customer-focused. Cost and Asset Management Efficiency are considered internal-focused. All SCOR metrics are grouped within one of the performance attributes.

Each Performance Attribute has one or more level-1/strategic metrics. These level-1 metrics are the calculations by which an organization can measure how successful it is in achieving its desired positioning within the competitive market space.

Performance Attribute	Level-1 Strategic Metric
Reliability	<ul style="list-style-type: none"> • Perfect Order Fulfillment (RL.1.1)
Responsiveness	<ul style="list-style-type: none"> • Order Fulfillment Cycle Time (RS.1.1)
Agility	<ul style="list-style-type: none"> • Upside Supply Chain Flexibility (AG.1.1) • Upside Supply Chain Adaptability (AG.1.2) • Downside Supply Chain Adaptability (AG.1.3) • Overall Value At Risk (AG.1.4)
Cost	<ul style="list-style-type: none"> • Total Cost to Serve (CO.1.001)
Asset Management Efficiency	<ul style="list-style-type: none"> • Cash-to-Cash Cycle Time (AM.1.1) • Return on Supply Chain Fixed Assets (AM.1.2) • Return on Working Capital (AM.1.3)

Table 2 - The SCOR Level-1 Metrics

The SCOR metrics are organized in a hierarchical structure. SCOR describes level-1, level-2 and level-3 metrics. The relationships between these levels is diagnostic. Level-2 metrics serve as diagnostics for level-1 metrics. This means that by looking at the performances of the level-2 metrics I can explain performance gaps or improvements for level-1 metrics. This type of analysis of the performance of a supply chain is referred to as metric decomposition or root-causing. Similarly level-3 metrics serve as diagnostics for level-2 metrics. The level of a metric is included in the codification of the metric itself.

Metrics codification has been introduced in SCOR 9.0 to ensure companies may adopt SCOR metrics without the need to rename their existing metrics.

The coding starts with the performance attributes: Reliability - RL, Responsiveness - RS, Agility - AG, Cost - CO, and Asset Management - AM. Each metric starts with this two letter code, followed by a number to indicate the level, followed by a unique identifier. For example: Perfect Order Fulfillment is RL.1.1 - a level-1 metric within the Reliability attribute. Perfect Condition is RL.2.4, a Reliability metric at level-2. And Transportation Cost is CO.3.022.

Note: The second number in the ID -- for example the 4 in RL.2.4 -- does NOT indicate any kind of priority, importance, or other meaning. The numbers were assigned initially alphabetically, and later based on logical grouping or first come first serve.

Note: Over time SCC may retire metrics, which will mean there are unassigned metric IDs. This is intended, to ensure backward compatibility to older revisions.

Processes

The Process section in SCOR provides a set of pre-defined descriptions for activities most companies perform to effectively execute their supply chains. The six macro-level SCOR processes Plan, Source, Make, Deliver, Return and Enable are well-known and widely adopted. SCOR identifies 2 more levels of process. Level here indicates the span of the process: A level-3 process is focused on a more detailed activity. A level-1 process spans multiple level-3 processes. Figure 2 shows the levels within the SCOR model processes.

Level-2 process categories determine the capabilities within the level-1 processes. The key level-2 processes are Make-to-Stock vs. Make-to-Order vs. Engineer-to-Order for Source, Make and Deliver processes and Defective vs. MRO vs. Excess for the Return process. Level-3 processes are process steps that are performed in a certain sequence in order to plan supply chain activities, source materials, make products, deliver goods and services and handle product returns.

Companies may develop standard process descriptions of activities within the level-3 processes -- so called level-4 processes. Level-4 processes are generally industry, product, location and/or technology specific. For example: Most if not all companies need to perform a task known as "receive, enter and validate a customer order". This is a level-3 process (for example sD1.2). The level-4 processes would describe the steps how the order was received. Examples would be EDI, fax, telephone, walk-in. Each of these may require a unique level-4 process description. Another step you would describe how the order was entered. EDI maybe automatically loaded by certain software, fax and phone orders are entered by the order desk, walk-ins are processed at the check out counter. And so on.

The level at which processes need to be described depends on the project. For most projects level-2 process diagrams help identify structural issues in the supply chain: "Why do we have a warehouse feeding a warehouse, feeding a warehouse?" or "Lead-time are long due to where we source some of these materials". Level-3 process diagrams help identify decision points, triggers and process disconnects. For example: A sourcing model where I only take inventory ownership after I shipped it to my customer -- a.k.a. "consignment inventory" -- is described at level-3. Another sourcing alternative vendor managed inventory is also defined at level-3. Both need the standard level-3 processes, but the way these processes are sequenced and who performs them is the differentiator.

Process codification differs by level. Level-1 processes are represented by a capital letter preceded by the letter s (this silent s in small caps stands for SCOR): sP for Plan, sS for Source, sM for Make, sD for Deliver and sR for Return. Level-2 processes add a number for most level-2 processes: sD1 for Deliver Stocked Products, sP3 for Plan Make. Level-3 processes add a period followed by a unique number: sD1.1 for Process Inquiry and Quote, sD1.2 for Receive, Enter and Validate Order. Exceptions exist for Return processes: Level-2 Return processes are split into Source Return (sSRx) and Deliver Return (sDRx) processes to acknowledge the difference between returning something yourself or receiving a return from your customer. The level-3 processes are aligned with these codes: sDR1.1 is Authorize Defective Product Return.

Note: Non of numbers in the ID indicate any kind of sequence, priority, importance, or other meaning. The numbers were assigned initially using an example sequence, and later based on first come first serve.

Practices

The practices section, formerly known as 'best practices', provides a collection of industry-neutral practices companies have recognized for their value. A practice is a unique way to configure a process or a set of processes. The uniqueness can be related to the automation of the process, a technology applied in the process, special skills applied to the process, a unique sequence for

performing the process, or a unique method for distributing and connecting processes between organizations.

SCOR recognizes that several different qualifications of practices exist within any organization (SCOR ID):

- Emerging practices (BP.E)
- Best practices (BP.B)
- Standard practices (BP.S)
- Declining practices. (BP.D)

SCOR recognizes the qualification of a practice may vary by industry or geography. For some industries a practice may be standard, whereas the same practice may be considered a emerging or best practice in another industry. The SCOR classification of practices has been established based on input from practitioners and experts from a diverse range of industries. All SCOR practices have been mapped to one or more classifications. SCOR 11 recognizes 21 classifications. Classifications help identify practices by focus area, for example: inventory management or New product introduction.

People

The People section of SCOR was introduced in SCOR 10 and provides a standard for describing skills required to perform tasks and manage processes. Generally these skills are supply chain specific. Some skills identified may be applicable outside the supply chain process domain.

Skills are described by a standard definition and association to other People aspects: Aptitudes, Experiences, Trainings and Competency level. Competency level is not included in the framework descriptions. SCOR recognizes 5 commonly accepted competency levels:

- Novice: Untrained beginner, no experience, requires and follows detailed documentation
- Beginner: Performs the work, with limited situational perception.
- Competent: Understands the work and can determine priorities to reach goals.
- Proficient: Oversees all aspects of the work and can prioritize based on situational aspects.
- Expert: Intuitive understanding. Experts can apply experience patterns to new situations.

These competency levels are used similarly as process or practice maturity levels. The person or job specification is evaluated on the found (person) or desired (job specification) level of competency.

Codification within the People section consists of coding of the Skills as well as the Aptitudes, Experiences and Training that define the Skills. All People elements start with a capital letter H followed by a capital letter representing the element: S for Skills, A for Aptitudes, E for Experiences and T for Trainings. These are followed by a period and a for digit number. For example HS.0010 is the code for Basic Finance skill, HT.0039 is the code for CTPAT training.

Note: The number in the ID -- for example the 0018 in HA.0018 -- does NOT indicate any kind of priority, importance, or other meaning. It is a unique identifier.

Changes in Revision 11

Revision 11.0 provides updates to 3 sections: Metrics, Processes and Practices:

- Cost metrics: A new level-1 Cost metric (Total Cost to Serve) replaces the prior Cost metrics that caused confusion. Cost of Goods Sold (COGS) has been demoted to a level-2 metric that serves as a diagnostic for Total Cost to Serve. Level-2 and level-3 metrics have defined/improved diagnostic parent-child relationships
- Enable processes: Enable is now a level-1 process, level-3 processes are no longer process categorizations, but at the same level of detail as Plan, Source, Make, Deliver and Return processes.
- Practices: All best practices are now classified, have clarified descriptions and are linked to processes and metrics

The cost metrics change was driven based on ongoing practitioner concerns that the level-1 metrics were confusing and created potential overlaps. SCOR 10.0 level-1 metrics were difficult to benchmark as the interpretation of Cost of Goods Sold (COGS) differs by industry, company and possibly even supply chain. Last but not least, practitioners raised the concern that making supply chain decisions based on COGS alone can lead to wrong outcomes. SCOR 11.0 introduces cost metrics that focus on the point of consumption or use. For example: Landed cost of purchased materials measures the total cost of bringing the materials to the point of use, instead of measuring the purchase price only. Cost of Goods Sold will remain a SCOR metric but has been demoted to level-2, thus serving as a diagnostic for Total Cost to Serve.

Revision 11 introduces a new level-1 process: Enable. Practitioners have asked for more clarification and detail on the enabling processes. The level-3 enabling processes contained many duplicates, yet the level of detail provided was higher than level-3 processes elsewhere in the framework. With the new SCOR 11 level-3 processes practitioners can now use the enabling processes the same way as other level-3 process. By introducing a level-1 process SCOR now also recognizes the importance of these enabling processes.

The changes to the practices section were driven by practitioners asking for better differentiation of practices by focus area ('what are all practices for inventory management?') and the desire to differentiate practices beyond best practices. SCOR 11.0 introduces 4 qualifications of practices: Emerging, Best, Standard and Declining, recognizing that not all business practices are considered best practices. The shift from best practices to practices reflects the shift in how companies are using practices: A wishlist of how they standardize (and automate) their processes.

Change	Type	SCOR ID#	Specific Change Description
1	Delete	sEP, sEP.1 - sEP.10	Removed Enable Plan processes
2	Delete	sES, sES.1 - sES.10	Removed Enable Source processes
3	Delete	sEM, sEM.1 - sEM.9	Removed Enable Make processes
4	Delete	sED, sED.1 - sED.9	Removed Enable Deliver processes
5	Delete	sER, sER.1 - sER.9	Removed Enable Return processes

Change	Type	SCOR ID#	Specific Change Description
6	Add	sE	Added level-1 Enable process
7	Add	sE1, sE1.1 - sE1.6	Added Manage Business Rules processes
8	Add	sE2, sE2.1 - sE2.6	Added Manage Performance processes
9	Add	sE3, sE3.1 - sE3.6	Added Manage Data & information processes
10	Add	sE4, sE4.1 - sE4.6	Added Manage Human Resources processes
11	Add	sE5, sE5.1 - sE5.8	Added Manage Assets processes
12	Add	sE6, sE6.1 - sE6.7	Added Manage Contracts processes
13	Add	sE7, sE7.1 - sE7.8	Added Manage Network processes
14	Add	sE8, sE8.1 - sE8.6	Added Manage Regulatory Compliance processes
15	Add	sE9, sE9.1 - sE9.5	Added Manage Risk processes
16	Delete	CO.1.1	Removed level-1 cost metric CO.1.1
17	Change	CO.1.2	Deprecated/renumbered to CO.2.008 Cost of Goods Sold
18	Change	CO.2.1	Renamed/renumbered to CO.2.001 Planning Cost
19	Change	CO.2.2	Renamed/renumbered to CO.2.002 Sourcing Cost
20	Delete	CO.2.3	Removed, split over CO.2.003 and CO.2.004 metrics
21	Add	CO.2.003	Added CO.2.003 Material Landed Cost metric
22	Add	CO.2.004	Added CO.2.004 Production Cost metric
23	Delete	CO.2.4	Removed, split over CO.2.005 and CO.2.006 metrics
24	Add	CO.2.005	Added CO.2.005 Order Management Cost
25	Add	CO.2.006	Added CO.2.006 Fulfillment Cost
26	Change	CO.2.5	Renamed/renumbered CO.2.007, parts included in CO.2.002, CO.2.005, CO.2.006
27	Removed	CO.2.7	Removed, split over multiple level-3 processes
28	Change	AM.1.2	Modified calculation to align with new cost metrics
29	Change	AM.1.3	Modified calculation to align with new cost metrics
30	Removed	No ID in SCOR 10	Removed all SCOR 10.0 best practices
31	Added	BP.E	Added emerging practices qualification
32	Added	BP.B	Added best practices qualification
33	Added	BP.S	Added standard practices qualification
34	Added	BP.D	Added declining practices qualification
35	Added	BP.001 - BP.161	Added new business practices
36	Removed	No ID in SCOR 10	Removed the Inputs/Outputs section

Table 3, Overview of changes

Contributors

The development of SCOR depends on the support and input from SCOR practitioners and SCC members. The following individuals have devoted time and/or effort to the development of revision 11.0 of SCOR. Thank you!

Table 4, List of volunteers

Change Process

The SCOR-model is developed and maintained by the voluntary efforts of Supply Chain Council (SCC) members. Unlike other organizations with large technical staffs, SCC depends on the contributions of its members to actively advance the state of knowledge in supply chain by identifying required model changes, researching and validating those changes, and developing the consensus regarding the proposed changes. SCOR-model versions prior to Version 6.0 were developed in a Committee structure that was focused on developing a stable, usable model that could be used by experienced SCC members as well as organizations newly introduced to the SCOR concept. In 2002, confident that the model's stability had been demonstrated with over 5 years of application experience by SCC members, Supply Chain Council shifted its technical development focus to specific implementation issues.

Today, the current technical development process relies on project teams composed of volunteers from Supply Chain Council member organizations. These project teams are short-lived groups that focus on specific model challenges. It is expected that the normal term of a project team will be between 3-6 months. The change process and the coordination of the project team activities is led by a group of elected volunteers, supported by a SCC project member (staff). Changes to the model are initiated by a SCC member or members. The primary mechanism for changing the model is the Project Team. These teams propose areas of investigation, pursue and develop proposals for model development and publish research results on the SCC website.

SCOR users (practitioners) can also provide feedback through the Supply Chain Council's website (Online Access). Member users can add comments to the SCOR metrics, processes, practices and skills. For more information about Online Access: <http://supply-chain.org/online-access>

Section 1

Performance

Introduction to Performance

The performance or metrics section of SCOR focuses on understanding the outcomes of the supply chain and consists of two types of elements: Performance Attributes (attributes) and Metrics.

Performance Attribute

A performance attribute is a grouping or categorization of metrics used to express a specific strategy. An attribute itself cannot be measured; it is used to set strategic direction. For example: "The LX product needs to be leading the competition in reliability" and "The xy-market requires us to be among the top 10 agile manufacturers". Metrics measure the ability to achieve these strategic directions. SCOR recognizes 5 performance attributes:

Reliability

The Reliability attribute addresses the ability to perform tasks as required. Reliability focuses on the predictability of the outcome of a process. Typical metrics for the reliability attribute include: On-time, the right quantity, the right quality. The SCOR key performance indicator (level-1 metric) is Perfect Order Fulfillment. Reliability is a customer focused attribute.

Responsiveness

The Responsiveness attribute describes the speed at which tasks are performed. Responsiveness addresses repeated speed of doing business. Example Responsiveness metrics are cycle time metrics. The SCOR key performance indicator for Responsiveness is Order Fulfillment Cycle Time. Responsiveness is a customer focused attribute.

Agility

The Agility attribute describes the ability to respond to external influences; the ability to and speed of change. External influences include: Non-forecastable increases or decreases in demand, suppliers or partners going out of business, natural disasters, acts of (cyber) terrorism, availability of financial resources (the economy), labor issues. The SCOR key performance indicators include Flexibility, Adaptability and Value-at-Risk. Agility is a customer focused attribute.

Cost

The Cost attribute describes the cost of operating the process. Typical costs include labor cost, material cost, transportation cost. The SCOR key performance indicators for Cost is Total Cost to Serve. Cost is an internal focused attribute.

Assets

The Asset Management Efficiency ('Assets') attribute describes the ability to efficiently utilize assets. Asset management strategies in supply chain include inventory reduction and in-source vs. outsource. Example metrics include: Inventory days of supply, capacity utilization. The SCOR key performance indicators include: Cash-to-Cash Cycle Time, Return on Fixed Assets. Asset Management Efficiency is an internal focused attribute.

Metric

A metric is a standard for measurement of the performance of a supply chain or process. SCOR metrics are diagnostic metrics (compare to how diagnosis is used in a medical office). SCOR recognizes three levels of pre-defined metrics:

- Level-1 metrics are diagnostics for the overall health of the supply chain. These metrics are also known as strategic metrics and key performance indicators (KPI). Benchmarking level-1 metrics helps establishing realistic targets to support the strategic directions.
- Level-2 metrics serve as diagnostics for the level-1 metrics. The diagnostic relationship helps to identify the root cause or causes of a performance gap for a level-1 metric.
- Level-3 metrics serve as diagnostics for level-2 metrics.

The analysis of performance of metrics from level-1 through 3 is referred to as metrics decomposition, performance diagnosis or metrics root cause analysis. Metrics decomposition is a first step in identifying the processes that need further investigation. (Processes are linked to level-1, level-2 and level-3 metrics).

SCOR recognizes 10 strategic metrics (level-1 metrics):

Attribute	Level-1 Metric
Reliability	Perfect Order Fulfillment
Responsiveness	Order Fulfillment Cycle Time
Agility	Upside Flexibility
	Upside Adaptability
	Downside Adaptability
	Overall Value-at-Risk
Cost	Total Cost to Serve
Asset Management Efficiency	Cash-to-Cash Cycle Time
	Return on Fixed Assets
	Return on Working Capital

Supply Chain Council recommends supply chain scorecards to contain at least one (1) metric for each performance attribute to ensure balanced decision making and governance.

Reliability

The percentage of orders meeting delivery performance with complete and accurate documentation and no delivery damage. Components include all items and quantities on-time using the customer's definition of on-time, and documentation - packing slips, bills of lading, invoices, etc.

Calculation

$$\frac{[\text{Total Perfect Orders}]}{[\text{Total Number of Orders}]} \times 100\%$$

Note, an Order is Perfect if the individual line items making up that order are all perfect.

The Perfect Order Fulfillment calculation is based on the performance of each Level 2 component of the order line to be calculated (product & quantity, date & time & Customer, documentation and condition). For an order line to be perfect, all of the individual components must be perfect.

- An order is considered perfect if the products ordered are the products provided and the quantities ordered match the quantities provided (% In Full).
- A delivery is considered perfect if the location, specified customer entity and delivery time ordered is met upon receipt (Delivery Performance to Customer Commit Date).
- Documentation supporting the order line is considered perfect if it is all accurate, complete, and on time (Accurate Documentation).
- The product condition is considered perfect if the product is delivered/faultlessly installed (as applicable) on specification, with the correct configuration, with no damage, customer ready, and is accepted by the customer (Perfect Condition)

The calculation of line item perfect order line fulfillment is based on the Level 2 components:

- Each component receives a score of 1 if it is judged to be perfect.
- It receives a score of 0 if not perfect.

If the sum of the scores equal the number of components (in this case, 4) the order line is perfectly fulfilled.

Data collection

Data for the components that are used to drive the calculation of supply chain performance are primarily taken from Deliver and impact Deliver Enable process elements. These are primarily associated with the original commitment (Customer Order Processing – D1.2, D 2.2, D3.3) and the satisfaction of that commitment (Receipt and Installation (as appropriate) – D1.11, D1.13, D1.14, D1.15, D2.11, D2.13, D2.14, D2.15, D3.11, D3.13, D3.14, D3.15). In addition, the documents necessary for support of the supply chain process should be scored across the set of Deliver process elements. The Enable Deliver Process Element - Assess Delivery Performance (ED.2) should be updated from metrics derived.

Discussion

The performance of the supply chain is considered “perfect” if the original commitment made to a customer is met through the supply chain.

An order is defined as a collection of one or more order lines representing a request to deliver specified quantities of goods or to render specific services. The order can further be defined as a request (with a specific identifier as a reference) to deliver specified items or to render specific services with specific prices, dates, and quantities. Commitments are made to a customer at the order line level, where an order line is defined as a line representing a commitment on a sales order. An order line always references a product or service.

For an order to be considered perfect the following standards must be met:

- Delivered complete; all items on the order line are delivered in the quantities specified
- Delivered on time to the initial commitment date, using the customer's definition of on-time delivery
- Documentation supporting the order including packing slips, bills of lading, invoices, quality certifications, etc., is complete and accurate
- Faultlessly installed (as applicable), correct configuration, customer-ready and accepted, no damage, on specification

Orders canceled by the customer are excluded from the metric. Order changes initiated by the customer and agreed to by the supplier supersede initial commitments and form a new comparative basis for the metric.

Often for date and quantity issues (and occasionally product), a range rather than a strict value is used. This is acknowledged as a standard practice; in those situations the standard measured is considered to be met perfectly if the range specified is satisfied.

The term "customer-ready" for the perfect condition standard may imply a subjective component based on the customer's satisfaction. Although condition may not be as rigorously measured as time or quantity it should be considered as a component if available, especially since this attribute measures performance of the supply chain which is, of course, ultimately measured by its customers.

It should also be noted that a corresponding evaluation of suppliers' performances could be determined by extending these standards to each supplier's ability to source products.

Hierarchy

BP.165	Convergence of SCOR with Lean and Six Sigma

Percentage of orders which all of the items are received by customer in the quantities committed. The number of orders that are received by the customer in the quantities committed divided by the total orders.

Calculation

$[\text{Total number of orders delivered in full}] / [\text{Total number of orders delivered}] \times 100\%$

An order is considered delivered "in full" if:

- All items ordered are the items actually provided, and no extra items are provided
- All quantities received by the customer match the order quantities (within mutually agreed tolerances)

Data Collection

Data for the components that are used to drive the calculation of % In Full are primarily associated with the original order processing step of 'Reserve inventory and Determine Delivery Date' (sD1.3, sD2.3, sD3.3), inventory availability (sM1.1, sM2.1, sM3.1) including inventory location accuracy (sE2), and the satisfaction of that commitment through the shipment and customer receiving processes (sD1.12, sD1.13, sD2.12, sD.2.13, sD3.12, sD3.13).

Discussion

Order quantities are based on item / quantity original commitments agreed to by the customer. Orders canceled by the customer are excluded from the metric. Order changes initiated by the customer and agreed to by the supplier supersede original commitments and form a new comparative basis for the metric. This metric has no "timing" element, such that orders deliberately split by the supplier should still be considered "in full" so long as all metric criteria are met. In some cases, such as for supplying bulk materials, committed quantities refer to a range that is acceptable to the customer rather than a strict value.

Several SCOR diagnostic metrics exist that can be used to focus "% In Full" improvement efforts. Some of these include:

- % Orders Scheduled to Requested Quantity
- Schedule Achievement
- Yield variability
- Planned Shipment Fill Rate (not yet defined)
- % Stock Outs (not yet defined)
- Inventory Cycle Count Accuracy (not yet defined)

Orders may not be filled completely to the customer's original request quantity due to the inability to schedule to the initial request. Breakdown may also occur from the inventory availability (including stock outs for Make-to-Stock and schedule achievement for Make-to-Order and Engineer-to-Order processes) and inventory location accuracy. Lastly, a deviation from the shipment plan may lead to inability to fulfill an order completely.

BP.022	MRP I
BP.144	Purchase Order Management
BP.145	Vendor Collaboration

The percentage of orders that are fulfilled on the customer's originally committed date.

Calculation

$$\frac{[\text{Total number of orders delivered on the original commitment date}]}{[\text{Total number of orders delivered}]} \times 100\%$$

An order is considered delivered to the original Customer commitment date if:

- The order is received on time as defined by the customer
- The delivery is made to the correct location and Customer entity

Data Collection

Data for the components that are used to drive the calculation of Delivery Performance to Customer Commit Date are primarily associated with the original order processing step of 'Reserve inventory and Determine Delivery date' (D1.3, D2.3 & D3.3), and the satisfaction of that commitment through the shipment and customer receiving processes (D 1.12, D1.13, D2.12, D2.13, D3.12, D3.13).

Discussion

Order delivery performance from a timing perspective is based on original commitments agreed to by the customer. The acceptable window for delivering on time should be defined in the customer's service level agreement. Orders canceled by the customer are excluded from the metric. Order changes impacting the timing of a delivery that are initiated by the customer and agreed to by the supplier supersede original commitments and form a new comparative basis for the metric. The original commitment date can refer to a range, rather than a strict date and time, that is acceptable to the customer (e.g. advanced shipments). This metric has no "In Full" element, such that partial deliveries can still be considered as meeting the Customer Commit Date so long as all metric criteria are met. Measuring the frequency of accepting the customer's original request date, vs. commit date, can be an important measure of customer satisfaction.

Several SCOR diagnostic metrics exist that can be used to focus delivery performance improvement efforts. Some of these include:

- % Orders Scheduled to Request
- % Orders Shipped on time (not yet defined)
- Carrier Performance Reliability (not yet defined)

Orders may not be delivered to the Customer Commit Date due to breakdowns in the order fulfillment and shipment process (e.g. Transportation availability). Orders may also be delivered late due to carrier delivery performance / issues.

Hierarchy	
RL.3.32	Customer Commit Date Achievement Time Customer Receiving

BP.167	Electronic Returns Tracking
BP.168	Rotable Spares Pool

Percentage of orders with on time and accurate documentation supporting the order, including packing slips, bills of lading, invoices, etc.

Calculation

$$\frac{[\text{Total number of orders delivered with accurate documentation}]}{[\text{Total number of orders delivered}]} \times 100\%$$

An order is considered to have accurate documentation when the following are accepted by the customer:

Documentation supporting the order includes:

- Shipping documentation:
 - Packing slips (Customers)
 - Bill of lading (Carriers)
 - Government or Customs documentation / forms
- Payment Documentation:
 - Invoice
 - Contractual outline agreement
- Compliance documentation
 - Material Safety Data Sheets
- Other required documentation
 - Quality certification

All documentation must be complete, correct, and readily available when and how expected by the customer, Government and other supply chain regulatory entities.

Data Collection

Data for the components that are used to drive the calculation of Accurate Documentation are primarily associated with the Deliver processing step of 'Load Product & Generate Shipping Documentation' (D1.11, D2.11, D3.11), and 'Invoice' (D1.15, D2.15, D3.15).

The data collection step is part of Assess Delivery Performance (ED2) and Manage Deliver Information (ED3)

Discussion

This metric is calculated at the order level. The timeliness and quality of the documentation is measured from the perspective of the customer, Government, and other regulatory entities. Documentation may be late or incomplete due to the inability to prepare/process the correct documentation on time. Inaccurate or late shipping documentation may prevent the product to be loaded or shipped, increase the customs delay, and delay the customer's acceptance of the order. Inaccurate or late invoices may also lead to the inability to fulfill the customer request.

The definition encompasses On time and Accurate documentation. However, on-time documentation implies a scheduled ship date and scheduled invoice date.

Accurate documentation metrics are similar to what exists for SOURCE process metrics

Possible diagnostic metrics that can be used to focus Accurate Documentation improvement efforts include:

- % orders documentation (shipping and invoice) processed on time
- % faultless invoices

Hierarchy

RL.3.31	Compliance Documentation Accuracy
RL.3.43	Other Required Documentation Accuracy
RL.3.45	Payment Documentation Accuracy
RL.3.50	Shipping Documentation Accuracy

Processes

sD1.11	Load Vehicle and Generate Shipping Documents
sD1.15	Invoice
sD2.11	Load Product & Generate Shipping Docs
sD2.15	Invoice
sD3.11	Load Product & Generate Shipping Docs
sD3.15	Invoice

Practices

BP.012	Lot Tracking
BP.030	Inventory Record Accuracy
BP.062	Master Data Accuracy
BP.147	Receiving Goods Inspection
BP.148	3-Way Delivery Verification

Percentage of orders delivered in an undamaged state that meet specification, have the correct configuration, are faultlessly installed (as applicable) and accepted by the customer.

Calculation

$$[\text{Number of orders delivered in Perfect Condition}] / [\text{Number of orders delivered}] \times 100\%$$

An order is considered to be delivered in perfect condition if all items meet the following criteria:

- Undamaged
- Meet specification and has correct configuration (as applicable)
- Faultlessly installed (as applicable) and accepted by the customer
- Not returned for repair or replacement (within the warranty period)

Data Collection

Data for the components that are used to drive the calculation of “Perfect Condition” are primarily associated with the receipt, installation (as applicable) and satisfaction of the order commitment (D1.13, D1.14, D2.13, D2.14, D3.13, D3.14). The Enable Deliver Process Element - Assess Delivery Performance (ED.2) should be updated to reflect this metric and its components. This data is typically available from a complaints, claims, or warranty/returns database.

Discussion

This metric, calculated at the order level, assesses the quality of products delivered through the supply chain from the customer’s perspective. Justified and non-justified product quality issues, claims and returns within the warranty period are included and count against this metric. Improving this metric lowers the supply chain cost associated with claims and returns.

Several SCOR diagnostic metrics exist that can be used to focus Perfect Condition improvement efforts. Some of these include:

- Cost of Noncompliance
- Damage and Shrinkage
- Scrap Expense
- Warranty Costs
- Yield Variability

Responsiveness

The average actual cycle time consistently achieved to fulfill customer orders. For each individual order, this cycle time starts from the order receipt and ends with customer acceptance of the order.

Calculation

[Sum Actual Cycle Times For All Orders Delivered] / [Total Number Of Orders Delivered] in days

Data collection

Data for the components that are used to drive the calculation of responsiveness are taken from the Source, Make and Deliver process elements.

Discussion

The order fulfillment cycle time as captured from the moment a customer places the order to the moment the order is fulfilled is considered to be a 'gross' cycle time. It represents all the time passed between these two events, regardless of whether this represented cycle time for the activities performed by the organization to fulfill the order (both value-add and non-value-add) or dwell time because the order was placed well in advance by the customer. As such, this gross order fulfillment cycle time does not truly reflect the responsiveness of the organization. Take for example an organization that needs six days to fulfill a certain customer order. If the customer places the order one day in advance, the gross order fulfillment cycle time will be seven days. If the customer places the order 3 months ahead (pre-ordering), the gross fulfillment cycle time will be 96 days. However, the fact that the customer pre-orders does not reduce the responsiveness of the organization. On the contrary, one can argue that it may increase the ability of the organization to meet that order as it allows the organization to plan ahead and fulfill the order in a more optimal way.

The responsiveness of the organization is determined by the cumulative cycle time for all activities that are required to fulfill the order, but should exclude any dwell time where no activity takes place.

Therefore the definition of Order Fulfillment Cycle Time consists of a 'gross' component and a 'net' component named Order Fulfillment Process Time, according to the following formula: Order Fulfillment Cycle Time = Order Fulfillment Process Time + Order Fulfillment Dwell Time. Note that dwell time will equal 0 for companies who do not utilize this metric, so Order Fulfillment Cycle Time will equal Order Fulfillment Process Time.

Order fulfillment dwell time is defined as 'any lead time during the order fulfillment process where no activity takes place, which is imposed by customer requirements'. Note that this dwell time is different from 'idle time' or 'non-value-add lead time', which is caused by inefficiencies in the organization's processes and therefore ultimately under responsibility of the organization. This kind of idle time should not be deducted from the gross order fulfillment cycle time.

Dwell time is mostly associated with the ordering process, where a customer may place an order in advance to reserve capacity/materials etc, but where the actual steps in the order fulfillment process take place later on. It is also common in the delivery process where the organization may be in principle ready to ship the product/service, but is requested by the customer to wait (for example to follow a certain shipment schedule).

Note that for those organizations where dwell time does not play a role, the dwell time can be taken as zero days which results in the net order fulfillment cycle time to be equal to the gross order fulfillment cycle time.

For benchmarking purposes it is recommended to use the Order Fulfillment Process Time, as this is the cycle time reflecting most accurately the responsiveness of the organization. It will also ensure

that those organizations in industries where dwell time is a factor can be benchmarked against organizations in industries where dwell time does not play a role.

The concept of dwell time applies not only to the level 1 metric, but also to all lower level metrics. This means that each lower level metric can have a gross component, consisting of the net component and dwell time. Because the lower level metrics are hierarchical (the cumulative sum of cycle times at level 2 or 3 should be equal to the cycle time at level 1.) The cumulative sum of dwell times at level 2 or 3 should total up to the dwell time at level 1.

The average time associated with Source Processes. (Processes: sS1, sS2, sS3)

Calculation

Source Cycle Time ~ (Identify Sources of Supply Cycle Time + Select Supplier and Negotiate Cycle Time) + Schedule Product Deliveries Cycle Time + Receive Product Cycle Time + Verify Product Cycle Time + Transfer Product Cycle Time + Authorize Supplier Payment Cycle Time

Discussion

Metrics in Level-3 that are used to drive the calculation of 'Source Cycle time' are taken from the Source process elements, depending on the possible strategies deployed by companies to fulfill orders such as make-to-stock, make-to-order or engineer-to-order. When make-to-stock or make-to-order strategy is deployed, the dashed optional metrics 'Identify Sources of Supply Cycle Time' and 'Select Supplier and Negotiate Cycle Time' are not used in the calculation.

Hierarchy

BP.046	Expedite Outbound Customer Shipments

The average time associated with Make Processes

Calculation

Make Cycle Time ~ (Finalize Production Engineering Cycle Time) + Schedule Production Activities Cycle Time + Issue Material/Product Cycle Time + Produce and Test Cycle Time + Package Cycle Time + Stage Finished Product Cycle Time + Release Finished Product To Deliver Cycle Time

Discussion

Metrics in Level 3 that are used to drive the calculation of 'Make Cycle time' are taken from the Make process elements, depending on the possible strategies deployed by companies to fulfill orders such as make-to-stock, make-to-order or engineer-to-order. When make-to-stock or make-to-order strategy is deployed, the dashed optional metric 'Finalize Production Engineering Cycle Time' is not used in the calculation. And also, the data for the calculation of Level 3 metrics may also depends on different make strategies, e.g., when make-to-stock strategy is deployed, the metric 'Issue Material/Product Cycle Time' means the time for issuing material; while when make-to-order or engineer-to-order is deployed, it will be a measure for calculating the cycle time for issuing sourced or in-process product.

In Make Cycle Time, there may be overlaps in the processes, so the "least amount of time" should be applied rather than the total sum.

Hierarchy	
RS.3.33	Finalize Production Engineering Cycle Time
RS.3.49	Issue Material Cycle Time
RS.3.101	Produce and Test Cycle Time
RS.3.114	Release Finished Product to Deliver Cycle Time

BP.039	Right Size Frequency of Production Wheel

The average time associated with Deliver Processes.

Calculation

Delivery Cycle Time \approx MAX {[Resources & Determine Delivery Date Cycle Time + (Consolidate Orders Cycle Time + Schedule Installation Cycle Time) + Build Loads Cycle Time + Route Shipments Cycle Time + Select Carriers and Rate Shipments Cycle Time], Receive Product from Make/Source Cycle Time} + Pick Product Cycle Time + Pack Product Cycle Time + Load Vehicle & Generate Shipping Documentation Cycle Time + Ship Product Cycle Time + (Receive & Verify Product Cycle Time) + (Install Product Cycle Time)

*The MAX function above is to indicate that sDx.3-sDx.7 may be in parallel with sDx.8 and whichever takes longer should determine the cycle time.

Discussion

Metrics in Level 3 that are used to drive the calculation of 'Deliver Cycle time' are taken from the Deliver process elements, depending on the possible strategies deployed by companies to fulfill orders such as make-to-stock, make-to-order or engineer-to-order. When make-to-stock or make-to-order strategy is deployed, the optional metric 'Schedule Installation Cycle Time' is not used in the calculation, otherwise the metric 'Consolidate Orders Cycle Time' will not be used.

And also, the data for the calculation of Level-3 metrics may also depends on different make strategies, e.g., when make-to-stock strategy is deployed, the metric 'Receive, Configure, Enter and Validate Order Cycle Time' may not include the Configure process.

Agility

The number of days required to achieve an unplanned sustainable 20% increase in quantities delivered.

Note - 20% is a number provided for benchmarking purposes. For some industries and some organizations 20% may be in some cases unobtainable or in others too conservative. The new operating level needs to be achieved without a significant increase of cost per unit. Component metrics (Upside Source Flexibility, Upside Make Flexibility, etc) can be improved in parallel and as a result, this calculation requires the result to be the least amount of time to achieve the desired result).

Calculation

Supply Chain Flexibility is the minimum time required to achieve the unplanned sustainable increase when considering Source, Make, and Deliver components.

Total elapsed days between the occurrence of the unplanned event and the achievement of sustained plan, source, make, deliver and return performance. Note: Elapsed days are not necessarily the sum of days required for all activities as some may occur simultaneously. For example, if it requires 90 days to achieve a 20% increase in raw material volume, 60 days for adding capital to support production, and no time to increase the ability to deliver, upside supply chain flexibility would be 90 days (if production changes can run concurrently with material acquisition activities) or as much as 150 days if production changes and material acquisition changes must run sequentially.

Data collection

Data for the components that are used to drive the calculation of supply chain flexibility are taken from the actual planning activities incurred in devising the actions to be taken and the execution activities themselves. Neither the complete set of activities nor any given subset of those activities can be identified except in either contingency plans (in which case they are hypothetical), special analytical simulations conducted for the purpose of predicting total elapsed time, or after the fact (when they have actually occurred and are unlikely to reoccur in the same combination). Flexibility measures are assumption based or based on historic events.

Discussion

Certainly enterprises deal with change all the time. In most cases, these changes are minor deviations from the “norm” or fleeting “blips” in the marketplace. Also, certainly, most supply chains move through these changes almost effortlessly and, in this regard, demonstrate equivalent flexibility. In many extreme cases, however, it is possible that a particular supply chain has reached a condition of relative rigidity (say, at capacity or rigid, constraining agreements with partners) and a seemingly minor increase in production requirement can consume much time and effort as the supply chain struggles to restore its capability to perform.

It is evidenced that enterprises engaged in appropriate business risk and competitive contingency planning activities will usually be in a better position to optimize overall supply chain performance and these activities are presented as best practices later in this document.

When change is known in advance (such as Wal-Mart requiring RFID devices on all delivered cases, or a major sourcing change is planned to occur), and is incorporated in the enterprise’s operating plan, then the time incurred to undertake the adaptation isn’t necessarily a reflection of the supply chain’s flexibility. While flexibility is still addressed, it is frequently clouded by other considerations in

the operating plan. Unplanned change is the primary consideration in measuring the supply chain's flexibility.

Practices

BP.126 Supply Chain Visibility System

The maximum sustainable percentage increase in quantity delivered that can be achieved in 30 days.

Notes: 30 days is an arbitrary number provided for benchmarking purposes. For some industries and some organizations 30 days may be in some cases unobtainable or in others too conservative. Note: Component metrics (Upside Source Adaptability, Upside Make Adaptability, etc) can be improved in parallel and as a result, this calculation requires the result to be the least increase in quantity sustainable in 30 days. The new operating level needs to be achieved without a significant increase of cost per unit.

Calculation

Supply chain adaptability is the least quantity sustainable when considering Source, Make, Deliver and Return components.

Data collection

Adaptability measures are assumption based or based on historic events. Some elements can be measured and taken as a basis for further considerations. Adaptability measures are based on the actual number of returns compared to the maximum number of returns which can be achieved within 30 days. The weakest component determines the overall volume.

Discussion

The calculation of Supply Chain Adaptability requires the calculation to be the least quantity sustainable when considering Source, Make, Deliver and Return components.

Source: Resource Availability Assessment & Ramp-up/Lead Time

Elements needed to establish delta in resources and what can be ramped up and sustained within 30 days based on the question “How much of an increase in quantities sourced (expressed as a percentage) can the company sustain, given 30 days”

Demand

- Additional source volume to be determined given ramped up resources below

Staffing

- Staff availability in procurement (underutilized FTE's)
- How much staff can be recruited/hired and trained fill gap between underutilized FTE's and FTE's needed to increase and sustain quantities sourced given 30 days

Capital

- Current capital availability
 - Credit line
 - Cash on hand
 - Accounting procedures
- How much capital can be obtained to increase quantities sourced given 30 days

Materials

- Sourcing Constraints
 - Time required in negotiating new source/volume contracts/terms
 - Time required to find/obtain additional sources
- All else equal in make, deliver, return, how much inventory (raw material and purchased finished goods) can be obtained, delivered and phased in and sustained for order fulfillment, including safety stock given 30 days.

Cycle Time

- Procurement order cycle time reestablished and sustained for increased quantities sourced given 30 days.
 - Time to place a purchase order
 - Supplier lead time

The maximum sustainable percentage increase in production that can be achieved in 30 days with the assumption of no raw material constraints.

Discussion

Make: Input

Current elements needed to fully understand future requirements, to establish the volume delta that can be sustained based on the question “How much of an increase in quantities produced (expressed as a percentage) can the company sustain, given 30 days?” These elements are mainly output metrics from other attributes . . . responsiveness, reliability, cost, asset management.

Demand

- Current make volumes
 - Amount of each item manufactured

Labor

- Labor needed to meet current demand
 - Productivity-units/orders per FTE
 - Needed, but may be underutilized

Capital/Assets

- Internal and External (outsourced) capacity needed for current demand throughput
 - Facilities, space
 - Manufacturing equipment, materials handling and packaging equipment, etc.
 - Needed, but may be underutilized
- Current capital requirements
 - Credit line
 - Cash on hand
 - Accounting procedures
 - Finance Procedures (outsource vs. in-source, make vs. buy, lease vs. purchase)

Materials

- All else equal in source, deliver and return, current inventory on hand (WIP and finished goods), including safety stock required to sustain current order fulfillment.
 - Assuming optimized inventory practices (no excess inventory)

Cycle Time

- Current manufacturing cycle time (all else equal including procurement order cycle time and supplier lead time)

Make: Resource Availability Assessment & Ramp-up/Lead Time

Elements needed to establish delta in resources and what can be ramped up and sustained within 30 days based on the question “How much of an increase in quantities produced (expressed as a percentage) can the company sustain, given 30 days”

Demand

- Additional make volume to be determined given increased resources below

Labor

- Direct labor availability and percent of labor used in manufacturing, not used in direct activity (underutilized FTE's)
- How much labor can be recruited/hired and trained fill gap between underutilized FTE's and FTE's needed to increase and sustain quantities produced given 30 days

Capital/Assets

- Current Internal Capacity utilization
 - Facilities, space
 - Manufacturing equipment, materials handling and packaging equipment, etc.
- Current capital availability
 - Credit line
 - Cash on hand
 - Accounting procedures
 - Finance Procedures (outsource vs. in-source, lease vs. purchase)
- How much capital can be obtained to fill gap between underutilized asset capacity and assets needed to increase and sustain quantities produced given 30 days
- How much assets/capacity can be obtained to fill gap between underutilized asset capacity and assets needed to increase and sustain quantities produced given 30 days
 - Facilities, space
 - Manufacturing equipment, materials handling and packaging equipment, etc.

Outsourcing Alternatives to capital

- Supplemental Outsource/lease availability
 - Facilities, lease building, etc.
 - Lease manufacturing equipment, materials handling and packaging equipment, etc.
 - Co-packers
- How much supplemental outsourced or leased resources or facilities can be obtained to increase and sustain quantities produced given 30 days

Materials

- All else equal in source, deliver and return, how much raw material inventory can be received and phased into manufacturing and produced into WIP and FG inventory, and sustained for order fulfillment, including safety stock given 30 days.

Cycle Time

- Manufacturing cycle time reestablished and sustained for increased quantities produced given 30 days.

Processes	
sM1	Make-to-Stock
sM2	Make-to-Order
sM3	Engineer-to-Order

The maximum sustainable percentage increase in quantities delivered that can be achieved in 30 days with the assumption of unconstrained finished good availability.

Discussion

Deliver: Input

Current elements needed to fully understand future requirements, to establish the volume delta that can be sustained based on the question “How much of an increase in quantities delivered (expressed as a percentage) can the company sustain, given 30 days?” These elements are mainly output metrics from other attributes ... Responsiveness, reliability, cost, asset management.

Demand

- Current delivery volume
 - Number of orders shipped

Labor

- Labor needed to meet current demand
 - Productivity-orders per FTE
 - Needed, but may be underutilized

Capital/Assets

- Internal and External (3PL) capacity needed for current demand throughput
 - Facilities, space
 - Fleet equipment, outside carrier loads, materials handling equipment, etc.
 - Needed, but may be underutilized
- Current capital requirements
 - Credit line
 - Cash on hand
 - Accounting procedures
 - Finance Procedures (outsource vs. in-source, make vs. buy, lease vs. purchase)

Materials

- All else equal in source, make, return, current finished goods inventory on hand (including safety stock required to sustain current order fulfillment)
 - Assuming optimized inventory practices (no excess inventory)

Cycle Time

- Current logistics order cycle time (all else equal including procurement order cycle time, supplier lead time, manufacturing cycle time, etc.)
 - Customer order processing cycle time (logistics only)
 - Dock-to-stock cycle time
 - Pick-to-ship cycle time
 - Transit time

Deliver: Resource Availability Assessment & Ramp-up/Lead Time

Elements needed to establish delta in resources and what can be ramped up and sustained within 30 days based on the question “How much of an increase in quantities delivered (expressed as a percentage) can the company sustain, given 30 days”

Demand

- Additional delivery volume to be determined given increased resources below

Labor

- Direct labor availability and percent of labor used in logistics, not used in direct activity (underutilized FTE's)
- How much labor can be recruited/hired and trained fill gap between underutilized FTE's and FTE's needed to increase and sustain quantities delivered given 30 days

Capital/Assets

- Current Internal Capacity utilization
 - Facilities, space
 - Fleet equipment, materials handling equipment, etc.
- Current capital availability
 - Credit line
 - Cash on hand
 - Accounting procedures
 - Finance Procedures (outsource vs. in-source, lease vs. purchase)
- How much capital can be obtained to fill gap between underutilized asset capacity and assets needed to increase and sustain quantities delivered given 30 days
- How much assets/capacity can be obtained to fill gap between underutilized asset capacity and assets needed to increase and sustain quantities delivered given 30 days
 - Facilities, space
 - Fleet equipment, materials handling equipment, etc.

Outsourcing Alternatives to capital

- Supplemental Outsource/lease availability
 - 3PL facilities, lease building, etc.
 - Full service lease fleet, materials handling, etc. equipment
 - Outside carriers
- How much supplemental outsourced or leased resources or facilities can be obtained to increase and sustain quantities delivered given 30 days

Materials

- All else equal in source, make, return, amount of how much finished goods inventory can be received/stocked, including safety stock to sustain quantities delivered given 30 days

Cycle Time

- Logistics cycle time reestablished and sustained for increased quantities delivered given 30 days (all else equal including procurement order cycle time, supplier lead time, manufacturing cycle time, etc.)
 - Customer order processing cycle time (logistics only)
 - Dock-to-stock cycle time
 - Pick-to-ship cycle time
 - Transit time

Processes	
sD1	Deliver Stocked Product
sD2	Deliver Make-to-Order Product
sD3	Deliver Engineer-to-Order Product
sD4	Deliver Retail Product

The maximum sustainable percentage increase in returns of raw materials to suppliers that can be achieved in 30 days.

Discussion

Source Return: Input

Assuming no supplier constraints, current elements needed to fully understand future requirements, to establish the volume delta that can be sustained based on the question “How much of an increase in quantities returned to suppliers (expressed as a percentage) can the company sustain, given 30 days?” These elements are mainly output metrics from other attributes . . . responsiveness, reliability, cost, asset management.

Demand

- Current return volume
 - Number of orders returned

Staff / Labor

- Procurement Staff / Logistics Labor needed to meet current returned volume
 - Productivity-orders returned per FTE
 - Needed, but may be underutilized

Capital/Assets

- Internal and External (3PL) capacity needed for current return throughput
 - Facilities, space
 - Fleet equipment, outside carrier loads, materials handling equipment, etc.
 - Needed, but may be underutilized
- Current capital requirements
 - Credit line
 - Cash on hand
 - Accounting procedures
 - Finance Procedures (outsource vs. in-source, lease vs. purchase)

Cycle Time

- Current supplier return order cycle time
 - Supplier return order processing cycle time (procurement and logistics)
 - Pick-to-ship cycle time
 - Transit time

Source Return: Resource Availability Assessment & Ramp-up/Lead Time

Assuming no supplier constraints, elements needed to establish delta in resources and what can be ramped up and sustained within 30 days based on the question “How much of an increase in quantities returned to suppliers (expressed as a percentage) can the company sustain, given 30 days”

Demand

- Additional supplier return volume to be determined given increased resources below

Staff / Labor

- Procurement staff / Logistics labor availability (underutilized FTE's)

- How much procurement staff/logistics labor can be recruited/hired and trained fill gap between underutilized FTE's and FTE's needed to increase and sustain quantities returned to suppliers given 30 days

Capital/Assets

- Current Internal Capacity utilization
 - Facilities, space
 - Fleet equipment, materials handling equipment, etc.
- Current capital availability
 - Credit line
 - Cash on hand
 - Accounting procedures
 - Finance Procedures (outsource vs. in-source, lease vs. purchase)

Practices

BP.126

Supply Chain Visibility System

The maximum sustainable percentage increase in returns of finished goods from customers that can be achieved in 30 days.

Discussion

Deliver Return: Input

Assuming no customer constraints, current elements needed to fully understand future requirements,

to establish the volume delta that can be sustained based on the question “How much of an increase in quantities returned from customers (expressed as a percentage) can the company sustain, given 30

days?” These elements are mainly output metrics from other attributes . . . responsiveness, reliability,

cost, asset management.

Demand

- Current return volume
 - Number of orders returned

Staff / Labor

- Customer Service Staff / Logistics Labor needed to meet current returned volume
 - Productivity-orders returned per FTE
 - Needed, but may be underutilized

Capital/Assets

- Internal and External (3PL) capacity needed for current return throughput
 - Facilities, space
 - Fleet equipment, outside carrier loads, materials handling equipment, etc.
 - Needed, but may be underutilized
- Current capital requirements
 - Credit line
 - Cash on hand
 - Accounting procedures
 - Finance Procedures (outsource vs. in-source, lease vs. purchase)

Cycle Time

- Current customer return order cycle time
 - Customer return order processing cycle time (customer service and logistics)
 - Transit time
 - Return processing and disposition cycle time

Deliver Return: Resource Availability Assessment & Ramp-up/Lead Time

Assuming no customer constraints, elements needed to establish delta in resources and what can be ramped up and sustained within 30 days based on the question “How much of an increase in quantities returned from customers (expressed as a percentage) can the company sustain, given 30 days”

Demand:

- Additional customer return volume to be determined given increased resources below

Staff / Labor

- Customer Service staff / Logistics labor availability (underutilized FTE's)

- How much customer service staff/logistics labor can be recruited/hired and trained fill gap between underutilized FTE's and FTE's needed to increase and sustain quantities returned from customers given 30 days

Capital/Assets

- Current Internal Capacity utilization
 - Facilities, space
 - Fleet equipment, materials handling equipment, etc.
- Current capital availability
 - Credit line
 - Cash on hand
 - Accounting procedures
 - Finance Procedures (outsource vs. in-source, lease vs. purchase)
- How much capital can be obtained to fill gap between underutilized asset capacity and assets needed to increase and sustain quantities returned from customers given 30 days
- How much assets/capacity can be obtained to fill gap between underutilized asset capacity and assets needed to increase and sustain quantities returned from customers given 30 days
 - Facilities, space
 - Fleet equipment, materials handling equipment, etc.

Outsourcing Alternatives to capital

- Supplemental Outsource/lease availability
 - 3PL facilities, lease building, etc.
 - Full service lease fleet, materials handling, etc. equipment
 - Outside carriers
- How much supplemental outsourced or leased resources or facilities can be obtained to increase and sustain quantities returned from customers given 30 days

Cycle Time

- Deliver return cycle time reestablished and sustained for increased quantities returned to suppliers given 30 days
- Customer return order processing cycle time (customer service and logistics)
 - Transit time
 - Return processing and disposition cycle time

Processes	
sDR2	Deliver Return MRO Product
sDR3	Deliver Return Excess Product
Practices	
BP.126	Supply Chain Visibility System

The reduction in quantities ordered sustainable at 30 days prior to delivery with no inventory or cost penalties.

Note: 30 days is an arbitrary number provided for benchmarking purposes. For some industries and some organizations 30 days may be in some cases unobtainable or in others too conservative.

Calculation

Downside Source Adaptability + Downside Make Adaptability + Downside Deliver Adaptability

Downside Supply Chain Adaptability is the least reduction sustainable when considering Source, Make, Deliver and Return components.

Data collection Adaptability measures are assumption based on historic events. Some elements can be measured and taken as a basis for further considerations.

Discussion The calculation of Supply Chain Adaptability requires the calculation to be the least quantity sustainable when considering Source, Make, Deliver and Return components.

- Profit & Loss (Income Statement) Impact
 - Revenue
 - COGS
 - SGA
- Balance Sheet Impact
 - Inventory

The raw material quantity reduction sustainable at 30 days prior to delivery with no inventory or cost penalties.

Discussion

Source: Input

Current elements needed to fully understand future requirements, to establish the volume delta that can be sustained based on the question “How much of a reduction in quantities sourced (expressed as a percentage) can the company sustain, given 30 days?” These elements are mainly output metrics from other attributes ... responsiveness, reliability, cost, asset management.

Demand

- Current source volumes
 - Amount of each item purchased

Staffing

- Staff needed to meet current demand
 - Productivity-purchase orders per FTE
 - Needed, but may be underutilized

Capital

- Current capital requirements
 - Accounting procedures

Materials

- All else equal in make, deliver, return, current inventory on hand (raw material and purchased finished goods), including safety stock required to sustain current order fulfillment.
 - Assuming optimized inventory practices (no excess inventory)
- Current sourcing/supplier constraints
 - Current contract terms.
 - Nature of items; commodity/sole source.

Cycle Time

- Current procurement cycle time
 - Time to place a purchase order
 - ! Supplier lead time

Source: Resource Availability Assessment & Ramp-down/Lead Time

Elements needed to establish delta in resources and what can be ramped down and sustained at 30 days prior to delivery based on the question “How much of a decrease in quantities sourced (expressed as a percentage) can the company sustain without inventory or cost penalties, given 30 days notice prior to delivery”

Demand

- Reduced source volume to be determined given ramped down resources below

Staffing

- Staff availability in procurement (underutilized FTE's)
- How much staff can be laid-off or diverted to other activities, without cost penalty, to ramp down to decreased quantities delivered given 30 days notice

Capital

- Current capital requirements
 - Accounting procedures for selling/diverting/recycling assets

Materials

- Sourcing Constraints
 - Time required in negotiating new source/volume contracts/terms
 - Time required to ramp down supplier inventory
- How much inventory (raw material and purchased finished goods) can be returned, sold or diverted without cost penalty to ramp down to decreased quantities delivered given 30 days notice

Cycle Time

- Procurement order cycle time reestablished and sustained for decreased quantities sourced given 30 days.
 - Time to place a purchase order
 - Supplier lead time

The numerical risk rating for supplier, customer or product. Normalized and used for comparison purposes.

Practices

Risk management in organizations traditionally resides within the finance function, due to its inherent focus on financial impact on the organization. However, most organizations do not assess the supply chain risk separately. In recent years, supply chain risk management (SCRM) has become the focus area for finance executives responsible for Enterprise Risk Management. Hence, there is a need to establish a common language to monetize the supply chain risk. Value at Risk (VaR) is a popular risk metric widely used by the finance industry to understand the risk exposure of a trading portfolio based on historic volatility.

Qualitative Relationship Description

The supply chain risk definition extends from supplier's supplier to customer's customer and the global environment they operate in. Hence, any event with a potential to disrupt linkages across the entire supply chain is considered as a Risk Event. Supply Chain Value at Risk – the sum of the probability of risk events times the monetary impact of the events which can impact any core supply chain functions (e.g. Plan, Source, Make, Deliver and Return) or key dependencies.

Simple VaR calculation:

$VaR = \text{Probability of Risk Event (P)} \times \text{Monetized Impact of Risk Event (I)}$

Advanced VaR calculation:

More accurate measures of VaR can be attained by applying more complex calculations, use of distributions and confidence intervals (see best practices section).

Since VaR is an estimate, traditional estimating techniques of describing accuracy can also be used i.e. + or – 5% (see best practices section).

The use of VaR allows organizations to look at all potential supply chain risks through one metric and helps prioritize mitigation efforts. All the risk events across supply chain functions Plan, Source, Make, Deliver, and Return can be rolled up to an overall VaR for the entire supply chain creating a financial lever to help integrate SCRM into the organization's overall risk management initiative.

Calculation

$\text{Supply Chain Risk VAR (\$)} = \text{VAR \$ (Plan)} + \text{VAR \$ (Source)} + \text{VAR \$ (Make)} + \text{VAR \$ (Deliver)} + \text{VAR \$ (Return)}$

Data Collection

A risk event is categorized as any process failure (below target KPI) or disruption which can adversely impact supply chain cost & performance. Following data are required for the simple VaR calculation:

- Probability of process failure – This should be calculated using historical data. Historical data of the specific process metrics (on time delivery, quality failures, supply delays, machine failures, etc) to calculate the number of times the event may perform below the target (probability). Also, the extent to which it is below the target when it fails.
- Probability of external risk event – Probability of disruptions like hurricane, earthquake can be derived through research data or expert opinions
- Risk Impact – This is a monetary estimate provided by the experts or business function specialist who can assess the repercussions of the risk event until normalcy is restored

More accurate measures of VaR can be attained by applying the more complex VaR calculation with the use of distributions and confidence intervals (see best practice section).

Discussion

VaR is a measure of an organization's exposure to supply chain risk events. The effort in measuring VaR on a periodic basis can provide organizations with an ability to mitigate or respond effectively to external and internal disruption events. Hence, VaR is a measure of Supply Chain Agility.

Suppliers can be evaluated based upon the VaR and ranked according to the risk of poor performance. Supply chain risk to customers can also be measured based upon performance measures (profitability, volume growth, returns, and complaints) as well as products (warranty claims, etc.). VaR can also be applied to internal supply chain entities such as manufacturing, distribution or sales locations. Since VaR is a monetized view of the cost of performance below target, it can be rolled up and examined by any demographic or data cut (by region, by customer, by supplier, etc.). Many of the mitigation costs captured in a risk management effort are already included in the Total Supply Chain Management Cost. For this reason, VaR cannot roll up to TSCMC Level 1 and is used as a diagnostic metric at Level 2 and 3.

Caveats in using VaR :

- VaR calculates the probability of non-adherence to metrics value (expected value) based on historical data or research data.
- Data accuracy and inherent prediction errors will also impact VaR accuracy.
- VaR is a retrospective and probabilistic derivation of an event risk, which is applied to predict the possible cumulative loss in the future due to similar risk events.
- VaR is a downside Risk Metric. It calculates the estimated loss for each level of probability for an event. There is no credit given for gains (early arrivals, etc.) for an event therefore it will differ from the average VaR of an event.
- Calculating VaR from historical data requires a large database of events and metrics, and it could be computationally intensive.

Cost

Cost of Goods Sold

CO.2.008

The sum of the supply chain cost to deliver products and services to customers. Total Cost to Serve includes the cost to plan the supply chain, cost to source materials, products, goods, merchandize and services, cost to produce, manufacture, remanufacture, refurbish, repair and maintain goods and services if applicable, cost to manage orders, customer inquiries and returns, and cost to deliver products and services at the agreed location (point of revenue).

Total Cost to Serve comprises of two types of cost:

- Direct cost. Cost that can be directly attributed to fulfilling customer orders. For example the cost of the materials used and/or delivered, all direct supply chain labor, etc.
- Indirect cost. Cost required (or occurring) to operate the supply chain. For example: Cost to lease and maintain equipment, inventory depreciation, damage and returns costs, and more.

Total Cost to Serve can be measured per event and at the aggregated supply chain level (assuming reporting capabilities exist). Measuring Cost to Serve at transactional level generally requires activity based costing capabilities for direct cost and a system to allocate indirect cost.

Calculation: Total Cost to Serve is the sum of:

- CO.2.001 Planning Cost
- CO.2.002 Sourcing Cost
- CO.2.003 Material Landed Cost
- CO.2.004 Production Cost
- CO.2.005 Order Management Cost
- CO.2.006 Fulfillment Cost
- CO.2.007 Returns Cost

Unit of Measure: Total Cost to Serve is measured in monetary units.

Notes: SCC strongly cautions against aggregating Total Cost to Serve for multiple supply chains as this may hide or overstate problems.

Hierarchy	
CO.2.001	Planning Cost
CO.2.002	Sourcing Cost
CO.2.003	Material Landed Cost
CO.2.004	Production Cost
CO.2.005	Order Management Cost

BP.161	Enterprise Level Spend Analysis
BP.165	Convergence of SCOR with Lean and Six Sigma

The total cost of personnel, automation, assets and overhead associated with supply chain planning processes. This includes activities associated with organizing, preparing, hosting and attending planning meetings, gathering and judging statistical demand data, gathering, aggregating and judging supply data, managing planning data and publishing plans.

Calculation: The sum of cost associated with supply chain planning processes. Planning Cost equals the sum of:

- Planning Labor Cost
- Planning Automation Cost
- Planning Property, Plant and Equipment Cost
- Planning Governance, Risk, Compliance (GRC) and Overhead Cost

Data collection: Data is collected by identification, allocation and assigning relevant cost of planning process related departments or by identification of the cost of planning activities (e.g. Activity Based Costing). The following cost should be excluded:

- Cost associated with scheduling of customer orders, production orders, purchase orders and return authorizations which are already included in Order Management Cost, Direct Make Labor Cost or Sourcing Cost.
- Other non-planning related costs that are included in cost metrics not listed above.

Unit of Measure: Planning Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

BP.035	Business Rule Review
BP.139	Vendor Managed Inventory (VMI)
BP.174	Supply Chain Risk Assessment

The total cost associated with managing the ordering, receiving, inspection and warehousing of materials, products, merchandise and services. These cost include labor costs for managing material acquisition, managing supplier performance, purchase order management, material handling, inspection and storage and sourcing overhead such as automation, facilities and indirect materials.

Calculation: The sum of all cost associated with the management and execution of purchasing materials. Sourcing Cost equals the sum of:

- Sourcing Labor Cost
- Sourcing Automation Cost
- Sourcing Property, Plant and Equipment Cost
- Sourcing Governance, Risk, Compliance (GRC) and Overhead Cost

Data collection: Data is collected by identification of relevant cost for each department or by activity (e.g. Activity Based Costing). The following cost should be excluded:

- The price paid for the materials and bringing these materials to the location of use or storage
- Cost of identifying, qualifying and selecting suppliers (except for sS3 : Engineer-to-order processes)
- Cost of negotiating pricing and conditions (except for sS3 : Engineer-to-order processes)
- Cost of pre-processing the material, as these would be Make related costs

Unit of Measure: Sourcing Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes: The total cost associated with Source processes is reported using two level-2 metrics: CO.2.003 Material Landed Cost (Landed Cost) is the cost of (or 'price paid' for) the materials; CO.2.002 Sourcing Cost is the cost to schedule and execute the receiving, handling, inspection and storage of these materials. In reporting Landed Cost and Sourcing Cost make sure no cost are duplicated or omitted.

Hierarchy	
CO.3.005	Sourcing Labor Cost
CO.3.006	Sourcing Automation Cost
CO.3.007	Sourcing Property, Plant and Equipment Cost
CO.3.008	Sourcing GRC, Inventory and Overhead Cost

Practices

BP.100 Strategic Sourcing

BP.101 Purchasing/Procurement Strategy

The labor costs associated with the personnel performing the ordering, receiving, processing and storing purchased materials. This includes activities associated with maintaining supplier data, processing payment, requesting and reviewing quotations, creating, changing and deleting purchase orders, scheduling transportation and delivery, arranging transportation insurance and customs clearance, unloading transportation vehicles, breaking bulk, inspecting, repackaging, storing and other material handling activities, requesting and providing status updates and approving payment of invoices. Sourcing labor cost measures the labor directly associated with these activities.

Labor cost includes: wages, income taxes (federal, national, state, regional, local), and employer contributions to health insurance, social security and retirement plans.

Sourcing Labor Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes: For returns supply chains (such as reverse logistics supply chains), Sourcing Labor Cost includes the cost associated with receiving and handling activities for returned materials and replacement parts.

BP.149	Supply Chain Risk Management Strategy Implementation and Analysis

The total cost associated with buying and making purchased materials, products or merchandize available to the location of use (location-of-use). These costs include the purchase price (net of any discounts), freight, insurance and other cost –such as import/export duties, tariffs and other taxes-associated with sourcing and delivery of the product or commodity to the location-of-use.

Calculation: The sum of the cost (actual price and expenses paid) to deliver materials or commodities to the location of use, expressed in monetary units:

- Purchased Materials Cost
- Material Transportation Cost
- Material Customs, Duties, Taxes and Tariffs Cost
- Material Risk and Compliance Cost

Data collection: Data is collected from (direct) material purchases paid or accrued. The following costs should be excluded:

- Cost of managing purchase requisitions and purchase orders, scheduling deliveries and processing supplier invoices
- Cost of identifying, qualifying and selecting suppliers
- Cost of negotiating pricing and conditions
- Cost of physical receipt, pre-processing, unpacking, inspecting and storing the material

Unit of Measure: Material Landed Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes: Location-of-use or -storage may be a raw material warehouse, a plant/factory where the materials are consumed in a Make process, a distribution center in make or buy supply chains or a warehouse, distribution center or store in retail supply chains. Direct materials included are:

- Raw materials for Make-products ²⁾)
- Packaging materials, such as boxes, bags, containers, labels, fillers
- Consumer packaged goods for Buy-products ²⁾)

Also known as: Total Landed Cost or TLC.

¹⁾) Cost of delivery to location of use for Source processes refers to the total spend to have sourced materials delivered to the location of use. If the purchase price includes transportation, insurance, import duties then Landed Cost includes the purchase price only. If purchase price is ex works than transportation, insurance, import duties should be added/included to purchase price of the goods and services. The terms and conditions of the agreement governing this blanket or purchase order determine what needs to be added to Landed Cost.

²⁾) Make and Buy products relate to the Make/Buy decision companies make as part of the product definition and design processes. A Make-product is a product that is produced vs. a Buy-product, which is bought as a whole. As an example: retailers primarily source and deliver buy-products.

Hierarchy	
CO.3.009	Purchased Materials Cost
CO.3.010	Material Transportation Cost
CO.3.011	Material Customs, Duties, Taxes and Tariffs Cost
CO.3.012	Material Risk and Compliance Cost

The total cost of the materials, merchandise and services purchased to produce the final product or for resale. Purchased Materials Cost is reported at purchase price net of any discounts. Any additional cost paid (not included in the purchase price) are excluded from Purchased Materials Cost - See Transportation Cost, Customs and Duties and Risk and Compliance Cost.

Purchased Materials Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes: Purchased Materials Cost equals Landed Cost if the price paid for the materials includes all cost associated with delivering the materials to the location of use, examples of such scenario are Consignment Inventory, Freight-and-Duties-Paid.

Processes	
sS1	Source Stocked Product
sS2	Source Make-to-Order Product
sS3	Source Engineer-to-Order Product
sE6	Manage Supply Chain Contracts

The costs associated with the physical transportation of purchased materials to the location-of-use. Transportation costs include the transportation equipment ownership --depreciation, equipment insurance, license and registration, financing-- and equipment operating costs (also known as the costs of driving): fuel, electricity, load insurance, maintenance and parking, tolls and other trip specific costs. Material handling cost at the receiving location (location-of-use) are excluded from Material Transportation Cost.

If transportation is (partially) outsourced then Transportation Cost is the sum of the invoices from the outsourcing partners plus any additional internal transportation cost incurred.

Material Transportation Cost is reported in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes: Material Transportation Cost is 0 (zero) if the price paid for the materials includes all cost associated with delivering the materials to the location of use, an example of such scenario is Consignment Inventory.

BP.136	Outsourced Reverse Logistics

The costs of import/export duties, taxes and tariffs, including the costs of third party services enabling customs clearance. Internal personnel cost related to customs and duties are reported in the Sourcing Cost and should therefore not be reported in the Materials Customs, Duties, Taxes and Duties Cost. Example costs included are:

- HTSUS
- EU VAT
- Import Control System acquisition, maintenance, service, licensing and disposition costs
- Harbor maintenance fee
- Customs Brokerage fees
- Less: Duty Drawback

Materials Customs, Duties, Taxes and Duties Cost is reported in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes: Materials Customs, Duties, Taxes and Duties Cost are 0 (zero) if one or more of the scenarios apply:

- The purchase price paid for the materials includes all cost associated with delivering the materials to the location of use, an example of such scenario is Consignment Inventory
- The purchased goods are delivered by the supplier directly at the customer all duties paid

The costs associated with acquiring purchased materials (and services). Example costs included in Material Risk and Compliance Cost are:

- Cost of theft, fraud, depreciation and shrinkage of in-transit goods
- C-TPAT program costs
- Carbon footprint mandate compliance costs
- Insurance costs (other than transportation related insurance)
- Cost of mitigation of potential risk of supply disruption
- Cost of compliance to Health, Safety and Environmental legislation

Material Risk and Compliance Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes: Material Risk and Compliance Cost can be 0 (zero) if the price paid for the materials includes all cost associated with delivering the materials to the location of use, an example of such scenario is Consignment Inventory.

BP.174	Supply Chain Risk Assessment

The total cost associated with managing and performing production¹⁾ processes, including scheduling production activities, picking materials and products, performing activities on the product - such as assembly, disassembly, mixing, forming, chemical processing and repairs - performing diagnostics, testing, packing, moving, storage and disposition of materials and products. The cost of materials used are not included in Production Cost. Production can be partially or fully outsourced, Production Cost can therefore include fees paid to a third party manufacturer, fees for temporary labor and permanent staff.

Calculation: The sum of costs for labor, rent/lease of facilities, equipment, automation, powering production locations and equipment for the production of goods/services. Production Cost equals the sum of:

- Production (Direct) Labor Cost
- Production Automation Cost
- Production Property, Plant and Equipment Cost
- Production Governance, Risk, Compliance (GRC), Inventory and Overhead Cost

Data collection: Data is collected by identification, allocation and assigning relevant cost of production (Make) process related departments or by identification of the cost of production activities (e.g. Activity Based Costing).

Unit of Measure: Production Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes: ¹⁾ The name production should be interpreted as Make. Production Cost represents all conversion or transformation processes described as Make in SCOR. This therefore includes assembly, disassembly, maintenance, repair, overhaul, recycling, refurbishment and so on.

Hierarchy	
CO.3.014	Production (Direct) Labor Cost
CO.3.015	Production Automation Cost
CO.3.016	Production Property, Plant and Equipment Cost
CO.3.017	Production GRC, Inventory and Overhead Cost

BP.147	Receiving Goods Inspection
BP.161	Enterprise Level Spend Analysis

The total cost associated with the personnel performing the activities of Make (producing, manufacturing, re-manufacturing, refurbishment, MRO, repair and/or recycling). This includes activities associated with scheduling production activities, bringing materials to the work floor, kitting, assembly, mixing, pre-processing, inspection, drying, curing, staging, releasing final products and managing make data. Direct labor refers to the personnel that performs activities that can be directly attributed to producing the products sold.

Labor cost includes: wages, income taxes (federal, national, state, regional, local), and employer contributions to health insurance, social security and retirement plans.

Calculation: The sum of all cost associated with the activities to produce products.

Data collection: Data is collected by identification, allocation and assigning relevant cost of production process related departments or by identification of the cost of production activities (Activity Based Costing). The following cost should be excluded:

- Manufacturing overhead, such as cost of facilities and equipment, warehousing cost, (customer) order management cost
- Indirect labor cost, such as Human Resources, Finance
- Labor Cost of third party service providers

Unit of Measure: Production (Direct) Labor Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes: SCOR recognizes that the primary purpose of certain supply chains may be to refurbish, repair or maintain products or recoup the value of materials (recycling). For these supply chains direct labor is calculated the same way.

BP.015	Safety Stock Planning
BP.174	Supply Chain Risk Assessment

The total cost of personnel, automation and assets associated with responding to inquiries and quotes, order entry and maintenance, scheduling transportation, order tracking and tracing, delivery, installation, invoicing. This may include the cost of managing customer credit and collections.

Calculation: The sum of cost associated with managing customer data, entry, maintenance, scheduling, prioritization and expedition of customer orders, invoicing and collections. Order Management Cost equals the sum of:

- Order Management Labor Cost
- Order Management Automation Cost
- Order Management Property, Plant and Equipment Cost
- Order Management Governance, Risk, Compliance (GRC) and Overhead Cost

Data collection: Data is collected by identification, allocation and assigning relevant cost of order management related departments or by identification of the cost of order management activities (e.g. Activity Based Costing). The following cost should be excluded:

- Cost associated with the physical handling of the product
- Cost associated with the storage of products
- Cost of transportation, delivery and installation
- Cost of leasing facilities and equipment related to physical fulfillment of orders

Unit of Measure: Planning Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes:

- Order management cost may include cost from call centers that take orders from customers or handle return requests. Call centers can perform both supply chain (SCOR) and sales and support (CCOR) processes. Order management cost should only include the supply chain related cost of such call center. Sales calls –such as promotions, cold calls- should not be included in supply chain costs and order management cost. Return authorization management costs are included in Order Management Cost.
- Order management is related to all processes that establish orders for delivery of goods and services. For example: if within one company a distribution center places an intra-company order on a factory then the cost associated with entering and maintaining this order are part of order management cost.
- In retail the order management cost are those cost associated with the creation of orders, invoicing and collections (generally referred to as check-out, but it also includes the cost of order creation for non deliver-from-stock goods and services), and also includes the cost associated with scheduling delivery and installation.

Hierarchy	
CO.3.018	Order Management Labor Cost
CO.3.019	Order Management Automation Cost
CO.3.020	Order Management Property, Plant and Equipment Cost

BP.142	Remote Return Authorization

The costs associated with the personnel performing the order management tasks of customer order entry, maintenance and scheduling of deliveries. This includes activities associated with maintaining customer data, processing payment, credit verification, responding to requests for product and quotations, creating, changing and deleting customer orders, scheduling transportation and delivery, arranging transportation insurance and customs clearance, providing status updates and issuing invoices. Order management labor cost measures the labor directly associated with these activities.

Labor cost includes: wages, income taxes (federal, national, state, regional, local), and employer contributions to health insurance, social security and retirement plans.

Order Management Labor Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes: In Retail, Order Management Labor Cost includes the cost of cashiers only. The cost of shelf stocking personnel, delivery and installation crews is included in CO.3.024 Fulfillment Labor Cost and the labor cost of backroom personnel is part of CO.3.005 Sourcing Labor Cost -- if such costs can be allocated separately.

Practices	
BP.099	Data Warehousing/Business Intelligence
BP.159	Electronic Data Interchange (EDI)

The costs associated with the (fixed) assets designated to support order management processes. PP&E costs include the cost of leases, rents, acquisition, depreciation, maintenance and disposition of land, buildings and equipment and labor cost and expenses of internal and/or external maintenance and support staff.

Cost of automation equipment is excluded from Order Management PP&E Cost as these cost are reported as Order Management Automation Cost. Labor costs associated with PP&E are reported in Order Management Property, Plant and Equipment Cost or alternatively Order Management Labor Cost. Avoid double counting or omission of these labor costs.

Order Management Property, Plant and Equipment Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Processes	
sD1	Deliver Stocked Product
sD2	Deliver Make-to-Order Product
sD3	Deliver Engineer-to-Order Product
sD4	Deliver Retail Product
sE5	Manage Supply Chain Assets

The governance, risk management, compliance and overhead costs allocated to order management processes (managing customer data, entry, maintenance, scheduling, prioritization and expedition of customer orders, invoicing and collections). This may include cost of supporting organizations, e.g. Human Resources department, Legal department, Quality department, as well as office supplies and other indirect cost. Example costs include:

- Quality management cost
- Cost of office supplies
- Risk mitigation costs
- Compliance remediation costs
- Process improvement costs
- Costs of office supplies

Order Management Governance, Risk, Compliance and Overhead Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Processes

BP.004	Network Prioritization for Risk Identification
BP.081	Bowtie Risk Management
BP.149	Supply Chain Risk Management Strategy Implementation and Analysis
BP.174	Supply Chain Risk Assessment

The total personnel, automation, assets and overhead cost associated with the fulfillment of orders. Fulfillment includes the physical handling of the product, such as storage, picking, packing and shipping. Transportation of goods between locations and return shipments is included in Fulfillment cost (transportation related to purchased materials, goods and services are not).

Calculation: The sum of cost for labor, rent/lease of facilities, equipment, automation, powering fulfillment locations (warehouses, shipping docks, distribution centers) and equipment for handling and transportation of goods. Fulfillment Cost equals the sum of:

- Transportation Cost
- Fulfillment Customs, Duties, Taxes and Tariffs Cost
- Fulfillment Labor Cost
- Fulfillment Automation Cost
- Fulfillment Property, Plant and Equipment Cost
- Fulfillment Governance, Risk, Compliance (GRC), Inventory and Overhead Cost

Data collection: Data is collected by identification, allocation and assigning relevant cost of fulfillment process related departments or by identification of the cost of fulfillment activities (e.g. Activity Based Costing). The following costs should be excluded: Order management cost

Unit of Measure: Fulfillment Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes:

- In a supplier-to-customer relationship the customer reports cost of inbound transportation in Material Landed Cost, the supplier reports the transportation cost in Fulfillment Cost. For intra-company shipments (for example shipment from a factory to a distribution center) the transportation cost should be reported once; either as Material Landed Cost or as Fulfillment Cost. Avoid double-counting and omitting these internal or intra-company transportation cost.
- In retail Fulfillment Cost include shelf-stocking cost and the cost of the delivery and installation at the customer site. If the supplier stocks shelves of the retailer the cost of stocking the shelves is part of the Material Landed Cost. Fulfillment costs include the cost to rent/lease and powering the store. Checkout and collections costs are part of Order Management Cost.

Hierarchy	
CO.3.022	Transportation Cost

BP.015	Safety Stock Planning
BP.174	Supply Chain Risk Assessment

The total cost of disposition of materials returned due to planning errors, supplier quality, production, order management and delivery errors. These costs can be described as the cost to 'rework' an imperfect delivery to the customer. For Defective Returns and Excess Returns the purpose of this metric is to report the additional cost of 'fixing' an imperfect delivery. For MRO (Maintenance, Repair and Overhaul) operations the Returns Cost are measured the same as for the other types of returns processes -return of defective products and return of excess products, but Discounts and Refunds are most likely zero (0).

Calculation: The sum of the costs of refunds, discounts and disposition of the materials, products and merchandize:

- CO.3.028 Discounts and Refunds Cost
- CO.3.029 Disposition Cost
- CO.3.030 Return Governance, Risk, Compliance (GRC), Inventory and Overhead Cost

Data collection: Data is collected by identification, allocation and assigning relevant cost of disposition, discounts and refunds to products and services returned. The following costs should be excluded:

- (Returns) Order Management Labor Cost¹⁾
- (Returns) Physical Handling Labor Cost¹⁾
- (Returns) Transportation Cost¹⁾
- (Returns) Automation Cost¹⁾
- (Returns) Property Plant and Equipment Cost¹⁾
- (Returns) Customs, Duties and Taxes Cost¹⁾
- (Returns) Governance, Risk, Compliance, Inventory and Overhead Cost¹⁾
- (Returns) Production Cost¹⁾

Unit of Measure: Returns Cost is measured in monetary units. For benchmarking purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes:

¹⁾ The cost of the returns related order management (return authorization management), transportation, handling, assets and overhead should be included in the respective costs. E.g. Returns related Order Management Labor Cost should be reported as CO.3.018 Order Management Labor Cost. Similarly the labor cost of the labor for the receiving dock of a Return facility is measured in the Sourcing labor cost metric. No returns specific metrics exist for returns-related order management labor costs as the order management labor cost are segregated by supply chain. A return supply chain is a separate supply chain from the revenue generating supply chain that may have caused the return.

Discussion

CO.1.003 Total Warranty Cost (as part of product and process design processes) measures the total warranty cost throughout the lifecycle of the product (this is the time between moment of acquisition and the moment of disposition by the user). The Returns Cost focuses on the initial cost of returns and primarily addresses the cost of returns for errors made in the supply chain. This includes returns costs related to damaged product, defective product (a.k.a. initial quality), order management and fulfillment errors (wrong product delivered, wrong quantities, etc.)

The purpose of Total Cost to Serve (the level-1 cost metric for supply chain) is to measure the cost of servicing the customer. Normal wear and tear as well as product quality issues that exhibit after a

'long time of use' are not intended to be included. Organizations interested in managing total warranty cost as part of supply chain are recommended to review the Total Warranty Cost (DCOR) CO.1.003 Total Warranty Cost and CO.2.007 Returns Cost may have some overlap, as a return of a damaged or defective product immediately after the delivery to the customer may be included in both metrics. This is not a major concern as Warranty Cost is not a component in the calculation of Total Cost to Serve (Returns Cost is a component of Total Cost to Serve).

BP.015	Safety Stock Planning

The governance, risk management, compliance, inventory and overhead costs allocated to returns processes. This may include cost of supporting organizations, e.g. Human Resources department, Legal department, Quality department, as well as office supplies and other indirect cost. These costs are primarily related to the decision-making processes and the cost of holding inventories of materials awaiting the completion of the disposition decision. The GRC, Inventory and Overhead costs related to repair, maintenance, overhaul, refurbishment, transportation and disposition (sale, waste disposal, return) are reported in the Make, Source and Deliver related cost metric. Example costs include:

- Inventory carrying cost - such as depreciation, shrinkage, theft
- Risk mitigation cost - such as insurance
- Compliance cost - local, national and international
- Quality management cost
- Process improvement cost
- Costs of office supplies

Return Governance, Risk, Compliance, Inventory and Overhead Cost is measured in monetary units. For benchmark purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Depreciated¹). The cost of direct materials, direct labor and overhead associated with the acquisition or production of finished goods. Cost of direct materials include the cost of purchased materials or goods and may include the cost of transportation, duties, taxes, insurance etc required to bring the materials to the point of use. Direct labor cost include the cost of personnel performing tasks associated with producing the final product. Labor cost includes: wages, income taxes (federal, national, state, regional, local), and employer contributions to health insurance, social security and retirement plans. Overhead includes the indirect cost related to producing the final product and are generally allocated based on normal capacity or expected volumes.

Calculation: Cost of Goods Sold is calculated as the sum of:

- Direct Labor (CO.3.013 Direct Labor Cost)
- Direct Materials (CO.3.009 Direct Materials Cost)
- Overhead Cost²) (CO.3.014 + CO.3.015 + CO.3.016 + CO.3.017)

Unit of Measure: Cost of Goods Sold is measured in monetary units. For benchmarking purposes these costs may be reported as a percentage of CO.1.001 Total Cost to Serve.

Notes:

- ¹) The importance of this metric has been lowered starting SCOR 11, due to the different interpretations of companies of the definition of COGS. There is no consensus globally, nationally, within industries and often even within large corporations about the calculation of COGS. This significantly lowers the value of using COGS in benchmarks (external and potentially internal). SCC recommends the usage of Cost to Serve and the associated diagnostic metrics for supply chain management purposes. Improving Cost to Serve and it's diagnostic metrics will improve Cost of Goods Sold.
- ²) The calculation of the Overhead component may differ from the sum of the metrics listed for your supply chain as Overhead is not wel defined as noted.

Asset Management Efficiency

The time it takes for an investment made to flow back into a company after it has been spent for raw materials. For services, this represents the time from the point where a company pays for the resources consumed in the performance of a service to the time that the company received payment from the customer for those services.

Calculation

Cash-To-Cash Cycle Time = [Inventory Days of Supply] + [Days Sales Outstanding] - [Days Payable Outstanding] in days.

Data collection

Unlike other SCOR metrics, where data requirements are specified, typically all of the cash-to-cash cycle time source data is already captured by business operating systems:

- general ledger system
- accounts receivable system
- accounts payable system
- purchasing system
- production reporting system
- customer relationship management system

As a result, information is 'calculated' by importing data from these systems and transforming them into the prescribed analytics/information. The transformation is accomplished using business rules.

Discussion

Cash-to-cash Cycle Time is a value metric used to measure how efficiently a company manages its working capital assets. This metric is a generally accepted Supply Chain metric within many industries and is used to benchmark supply chain asset management performance. The Cash-to-Cash Cycle time is measured by converting into days the supply of inventory in stock and the number of days outstanding for accounts receivable and accounts payable. The inventory days of supply is added to the days outstanding for accounts receivable. The accounts payable days outstanding is subtracted from this total to determine the cash-to-cash cycle time. The longer the cash-to-cash cycle, the more current assets needed (relative to current liabilities) since it takes longer to convert inventories and receivables into cash. In other words, the longer the cash-to-cash cycle, the more net working capital required.

BP.165	Convergence of SCOR with Lean and Six Sigma

The length of time from when a sale is made until cash for it is received from customers. The amount of sales outstanding expressed in days.

Calculation

5 point annual average of gross accounts receivable / (total gross annual sales / 365) in days.

Processes	
sD2.15	Invoice
sE6	Manage Supply Chain Contracts

The amount of inventory (stock) expressed in days of sales.

Calculation

$$\frac{[\text{5 point rolling average of gross value of inventory at standard cost}] / [\text{Annual Cost of Goods Sold (COGS)}]}{365}$$
 in days

Example: If 2 items a day are sold and 20 items are held in inventory, this represents 10 days (20/2) sales in inventory. (Other names: Days cost-of-sales in inventory, Days sales in inventory). Compare to inverse: Inventory Turns.

Hierarchy	
AM.3.16	Inventory Days of Supply - Raw Material
AM.3.17	Inventory Days of Supply - WIP
AM.3.23	Recycle Days of Supply

BP.087	ABC Inventory Classification

BP.156	Collaborative Planning, Forecasting and Replenishment (CPFR)
BP.162	Long Term Supplier Agreement/Partnership
BP.164	Consignment Inventory Management

The length of time from purchasing materials, labor and/or conversion resources until cash payments must be made expressed in days. (Other names: Average payment period for materials, Days purchases in accounts payable, Days outstanding in accounts payable)

Calculation

$$[5 \text{ point rolling average of gross accounts payable (AP)}] / [\text{total gross annual material purchases} / 365]$$

The '5 point rolling average' calculation uses a combination of both historical and forward-looking data. This means that the rolling average value has to be calculated based on the average over the four previous quarters and the projection for the current or next quarter.

Processes	
sS1	Source Stocked Product
sS2	Source Make-to-Order Product
sS3	Source Engineer-to-Order Product
sE6	Manage Supply Chain Contracts

Practices	
BP.005	Self-Invoicing
BP.148	3-Way Delivery Verification

Return on Supply Chain Fixed Assets measures the return an organization receives on its invested capital in supply chain fixed assets. This includes the fixed assets used in Plan, Source, Make, Deliver, and Return.

Calculation

Return on Supply Chain Fixed Assets = $([\text{Supply Chain Revenue}] - [\text{Total Cost to Serve}]) / [\text{Supply-Chain Fixed Assets}]$

Data collection

Unlike other SCOR metrics, where data requirements are specified, typically all of the required source data is already captured by business operating systems:

- general ledger system
- accounts receivable system
- accounts payable system
- purchasing system
- production reporting system
- customer relationship management system

As a result, information is 'calculated' by importing data from these systems and transforming them into the prescribed analytics/information. The transformation is accomplished using business rules. In order to measure Return on Supply Chain Fixed Assets, the investment in supply chain capital assets needs to be known. This requires a clear understanding of what is a "supply chain fixed asset". The SCOR sE5 process element is used since it is focused on managing supply chain capital assets. The value of these assets is the denominator of the metric.

Discussion

The return on supply chain fixed assets is measured by monetizing the supply chain revenue, cost of goods sold and supply chain management costs to determine the profit from the respective supply chain. This amount is divided by the supply chain fixed assets to determine the return generated from the respective supply chain. "Supply Chain Revenue" is used in the metric rather than just Net Revenue. There is a need for a more specific "revenue" number than "Net Revenue" for use in the "Supply Chain Revenue" level-2 metric. Net Revenue could include revenue from sources other than the supply chain, such as investments, leasing real estate, court settlements, etc...

Supply Chain Revenue will be used and will be only the portion of Net Revenue that is generated by the specific supply chain being measured and analyzed. Range of fixed assets used in an organization that have the character of permanency rather than being rapidly replaced (or expensed); examples include land, warehouse, trucks, buildings, investments, and plant and machinery. Fixed assets used to operate the Supply Chain in each of the categories (sP, sS, sM, sD, sR) are managed by the sE5 process. A Revised Capital Plan is an output of the Manage Supply Chain Fixed Assets (sE5) process and would contain supply chain capital asset information that could be used in measuring the Supply Chain Fixed Asset Value.

Practices	
BP.130	Identification of Obsolete Capital Assets

Return on working capital is a measurement which assesses the magnitude of investment relative to a company's working capital position versus the revenue generated from a supply chain. Components include accounts receivable, accounts payable, inventory, supply chain revenue, cost of goods sold and supply chain management costs.

Calculation

Return on Working Capital = $([\text{Supply Chain Revenue}] - [\text{Total Cost to Serve}] / ([\text{Inventory}] + [\text{Accounts Receivable}] - [\text{Accounts Payable}])$

Data collection

Unlike other SCOR metrics, where data requirements are specified, typically all of the required source data is already captured by business operating systems:

- general ledger system
- accounts receivable system
- accounts payable system
- purchasing system
- production reporting system
- customer relationship management system

As a result, information is 'calculated' by importing data from these systems and transforming them into the prescribed analytics/information. The transformation is accomplished using business rules.

Discussion

The return on working capital is measured by monetizing the supply chain profit and dividing into the calculated amount the supply chain working capital position. "Supply Chain Revenue" is used in the metric rather than just Net Revenue. There is a need for a more specific "revenue" number than "Net Revenue" for use in the "Supply Chain Revenue" level-2 metric. Net Revenue could include revenue from sources other than the supply chain, such as investments, leasing real estate, court settlements, etc... Supply Chain Revenue will be used and will be only the portion of Net Revenue that is generated by the specific supply chain being measured and analyzed.

Section 2

Processes

Introduction to Processes

A process is a unique activity performed to meet pre-defined outcomes. The processes in SCOR have been identified as unique processes a supply chain requires to execute in order to support its primary objective to fulfill customer orders. For each unique process SCOR only has one representation †.

SCOR recognizes 6 major processes (level-1 processes):

Plan

The Plan processes describe the activities associated with developing plans to operate the supply chain. The Plan processes include the gathering of requirements, gathering of information on available resources, balancing requirements and resources to determine planned capabilities and gaps in demand or resources and identify actions to correct these gaps.

Source

The Source processes describe the ordering (or scheduling of deliveries) and receipt of goods and services. The Source process embodies the issuance of purchase orders or scheduling deliveries, receiving, validation and storage of goods and accepting the invoice from the supplier. With the exception for Sourcing Engineer-to-Order goods or services, all supplier identification, qualification and contract negotiation processes are not described using Source process elements. See DCOR (www.supply-chain.org/dcor).

Make

The Make processes describe the activities associated with the conversion of materials or creation of the content for services. Conversion of materials is used rather than 'production' or 'manufacturing' as Make represents all types of material conversions: Assembly, Chemical processing, Maintenance, Repair, Overhaul, Recycling, Refurbishment, Remanufacturing and other common names for material conversion processes. As a general guideline: These processes are recognized by the fact that 1 or more item numbers go in and 1 or more different item numbers come out of this process.

Deliver

The Deliver processes describe the activities associated with the creation, maintenance and fulfillment of customer orders. The Deliver process embodies the receipt, validation and creation of customer orders, scheduling order delivery, pick, pack and shipment and invoicing the customer. The sD4 Deliver Retail process provides a simplified view of Source and Deliver processes operated in a Make-to-Stock-only retail operation.

Return

The Return processes describe the activities associated with the reverse flow of goods. The Return process embodies the identification of the need to return, the disposition decision making, the scheduling of the return and the shipment and receipt of the returned goods. Repair, recycling, refurbishment and remanufacturing processes are not described using Return process elements. See Make.

Enable

The Enable processes describe the associated with the management of the supply chain. Enable processes include management of business rules, performance management, data management, resource management, facilities management, contract management, supply chain network management, managing regulatory compliance and risk management.

For each level-1 process 3 or more differentiating level-2 process categorizations exist. Each level-2 process contains level-3 process elements. These hierarchical relationships provide classification of processes.

† It is recognized that some processes are duplicated throughout the SCOR model. This includes processes: sD1.13, sD1.14, sD2.13, sD2.14, sD3.13, sD3.14, sD4.1 - sD4.7.

Plan

The processes associated with determining requirements and corrective actions to achieve supply chain objectives.

Hierarchy	
sP1	Plan Supply Chain
sP2	Plan Source
sP3	Plan Make
sP4	Plan Deliver
sP5	Plan Return
Metrics	
CO.1.001	Total Cost to Serve
CO.2.001	Planning Cost

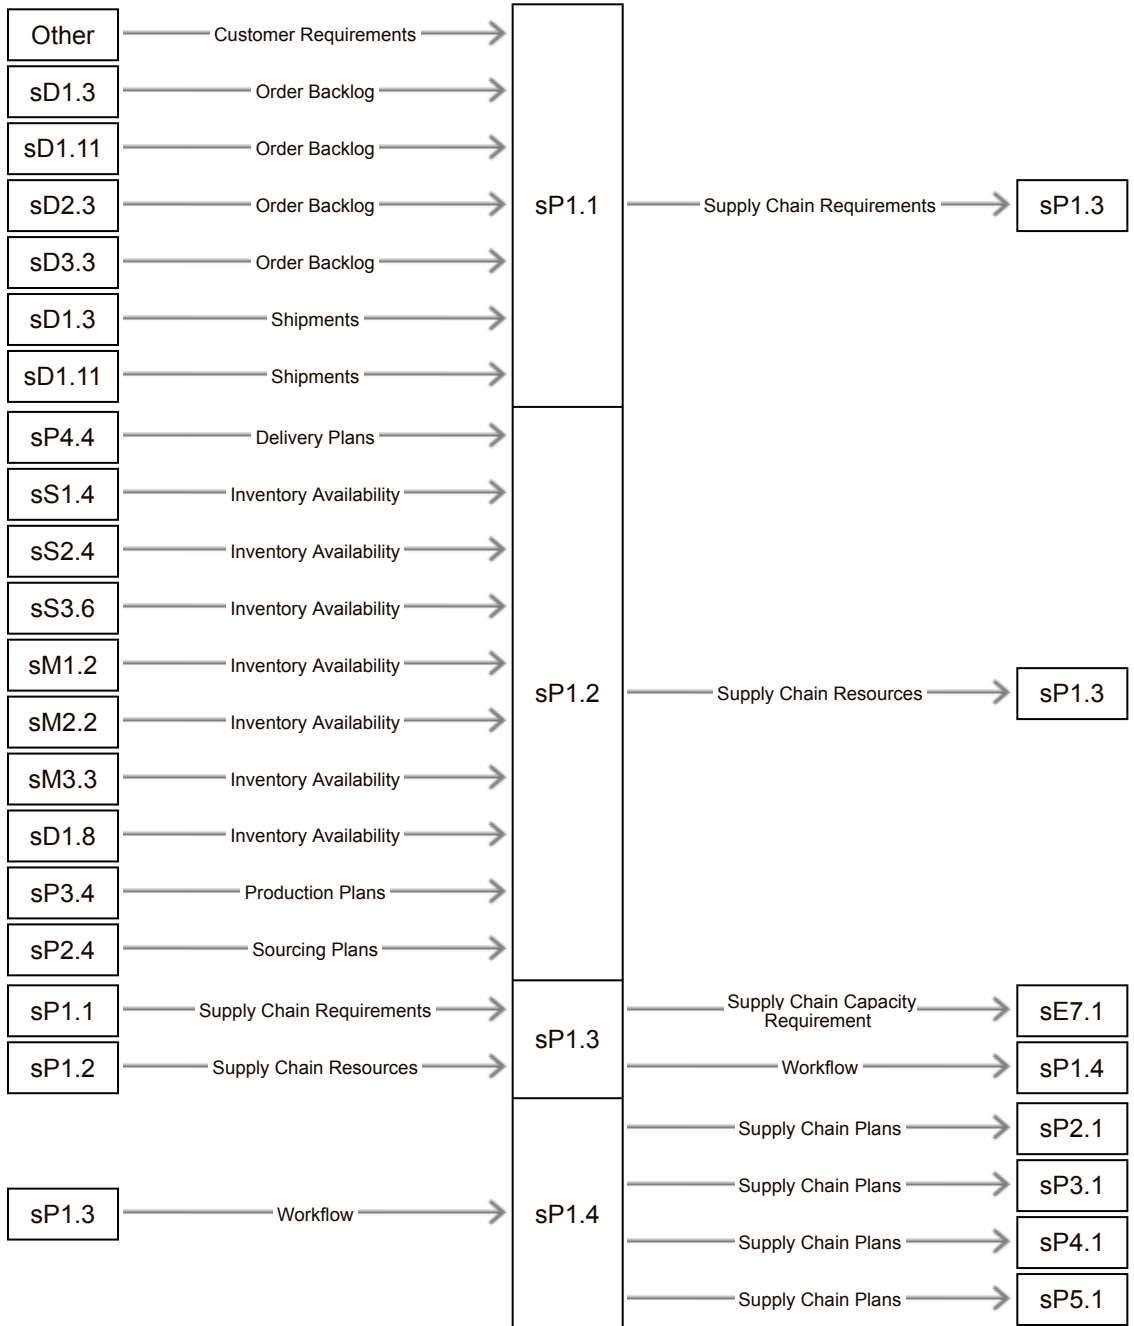

The development and establishment of courses of action over specified time periods that represent a projected appropriation of supply chain resources to meet supply chain requirements for the longest time fence constraints of supply resources.

Hierarchy	
sP1.1	Identify, Prioritize and Aggregate Supply Chain Requirements
sP1.2	Identify, Prioritize and Aggregate Supply Chain Resources

Workflow

The process of identifying, aggregating, and prioritizing, all sources of demand for the integrated supply chain of a product or service at the appropriate level, horizon and interval. The sales forecast is comprised of the following concepts: sales forecasting level, time horizon, and time interval. The sales forecasting level is the focal point in the corporate hierarchy where the forecast is needed at the most generic level. i.e. Corporate forecast, Divisional forecast, Product Line forecast, SKU, SKU by Location. The sales forecasting time horizon generally coincides with the time frame of the plan for which it was developed i.e. Annual, 1-5 years, 1- 6 months, Daily, Weekly, Monthly. The sales forecasting time interval generally coincides with how often the plan is updated, i.e. Daily, Weekly, Monthly, and Quarterly.

Workflow

Source

The processes associated with ordering, delivery, receipt and transfer of raw material items, subassemblies, product and/or services.

Hierarchy	
sS1	Source Stocked Product
sS2	Source Make-to-Order Product
sS3	Source Engineer-to-Order Product

Metrics	
CO.1.001	Total Cost to Serve
CO.2.002	Sourcing Cost
CO.2.003	Material Landed Cost

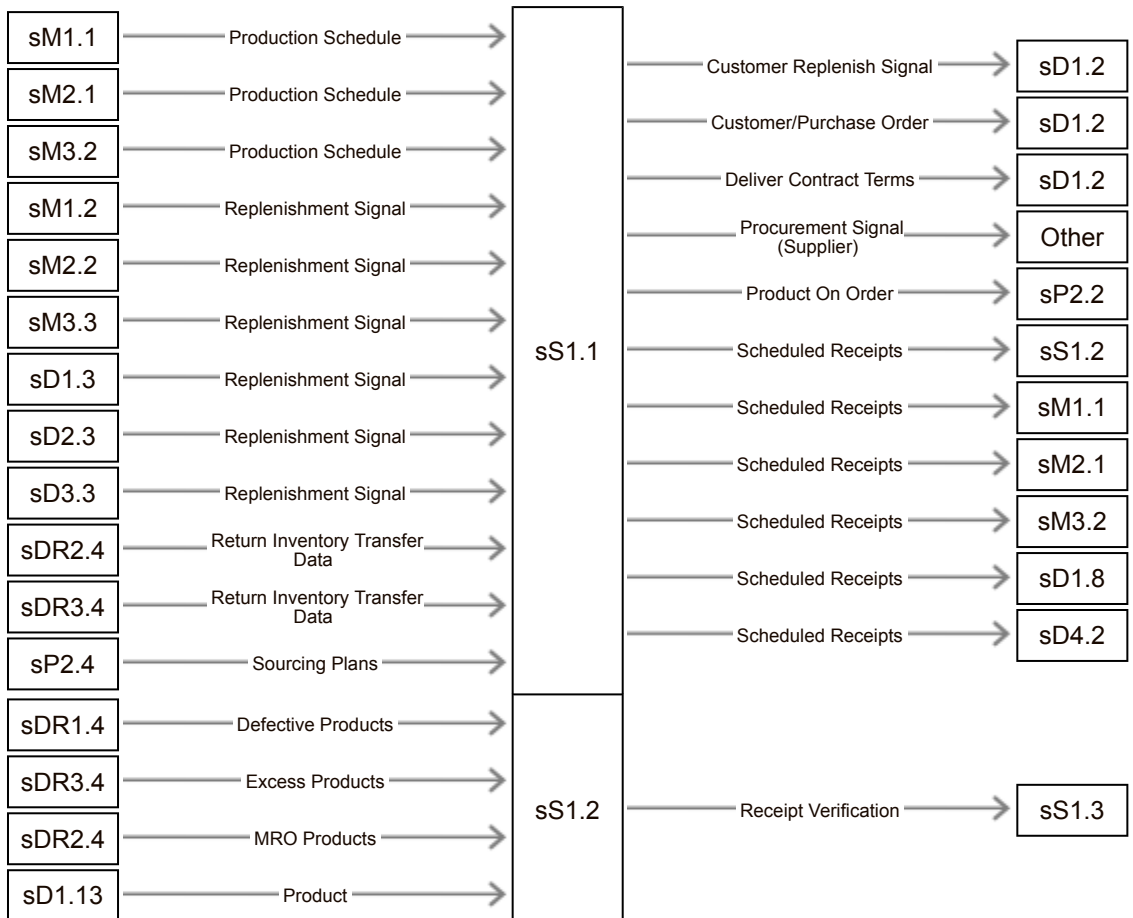

The process of ordering, receiving and transferring raw material items, sub-assemblies, product and or services based on aggregated demand requirements. The intention of Source-to-Stock is to maintain a pre-determined level of inventory for these materials, sub-assemblies or products. No customer reference or customer order detail is exchanged with the supplier, attached to or marked on the product, or recorded in the warehousing or ERP system for Source-to-Stock products. Examples of alternative or related names for Source-to-Stock are: replenishment inventory, drip parts, kan-ban, andon, and bulk or generic stock.

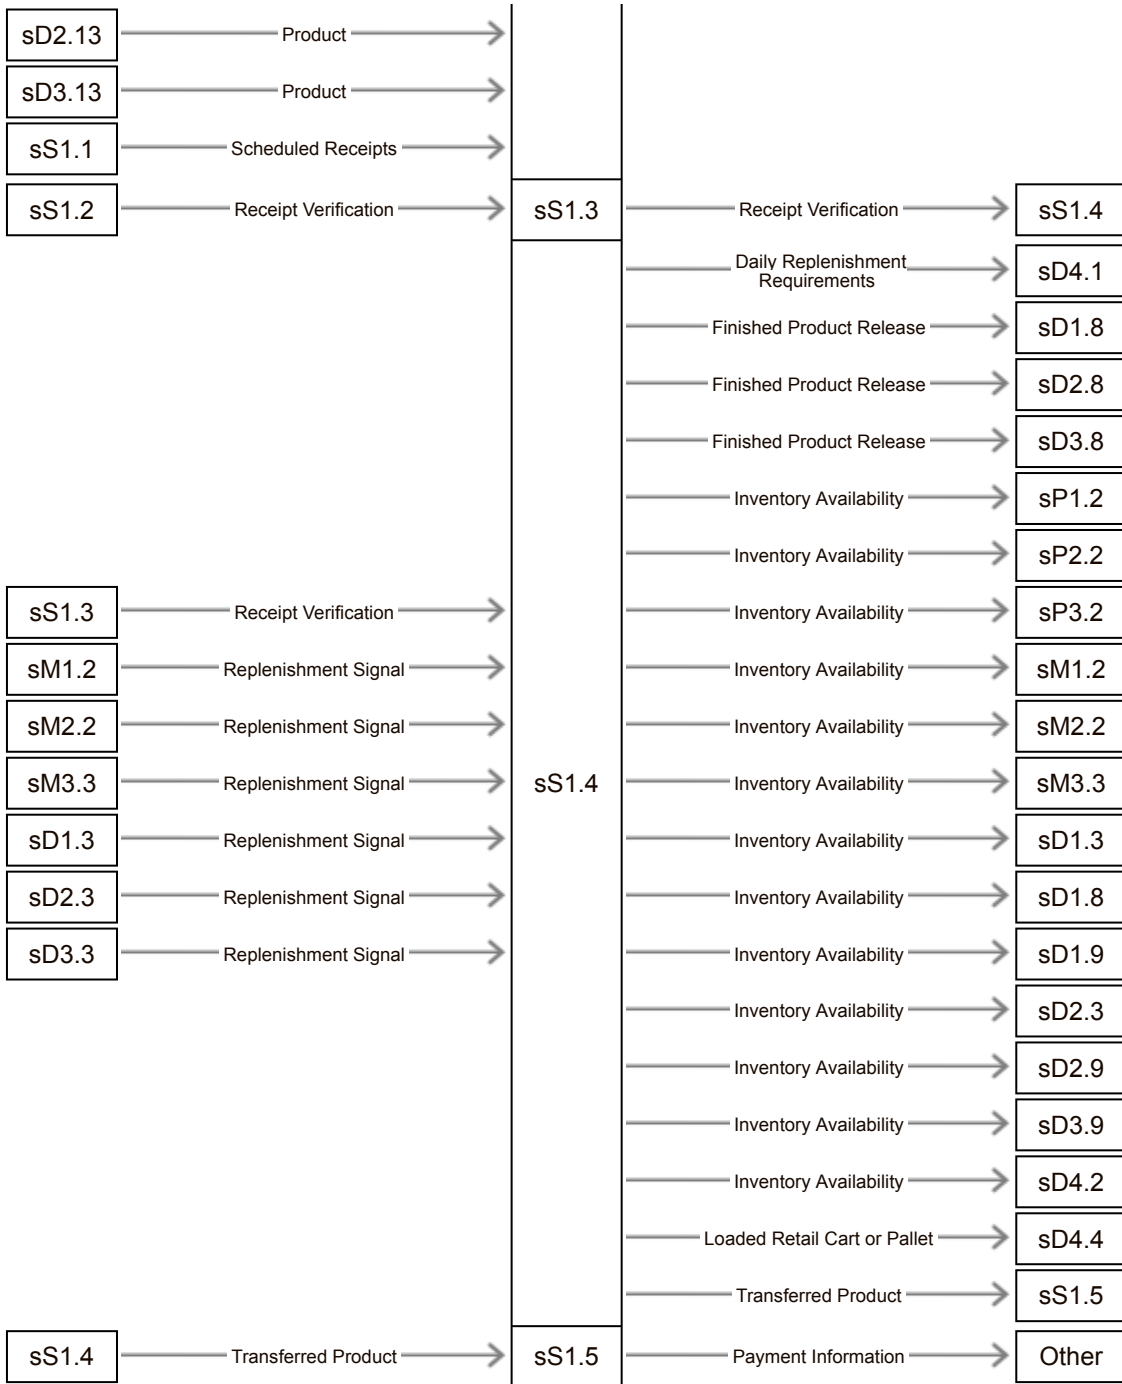

Hierarchy	
sS1.1	Schedule Product Deliveries
sS1.2	Receive Product
sS1.3	Verify Product
sS1.4	Transfer Product
sS1.5	Authorize Supplier Payment

Workflow

The processes of ordering and receiving product or material that is ordered (and may be configured) only when required by a specific customer order. The intention of Source-to-Order is to maintain inventory ordered (and/or configured) specifically for customer orders only. The product is ordered, received and identified in stock using this customer order reference (order designated inventory). The product is typically identifiable throughout the sourcing process, by the reference to the customer order attached to or marked on the product or packaging and in the warehouse management or ERP system. Examples of alternative or related names for Source-to-Order are: purchase-to-order, special ordering (retail industry), kitting and line sequencing (manufacturing industries).

Make

The process of adding value to products through mixing, separating, forming, machining, and chemical processes.

Hierarchy	
sM1	Make-to-Stock
sM2	Make-to-Order
sM3	Engineer-to-Order

Metrics	
CO.1.001	Total Cost to Serve
CO.2.004	Production Cost
CO.2.008	Cost of Goods Sold

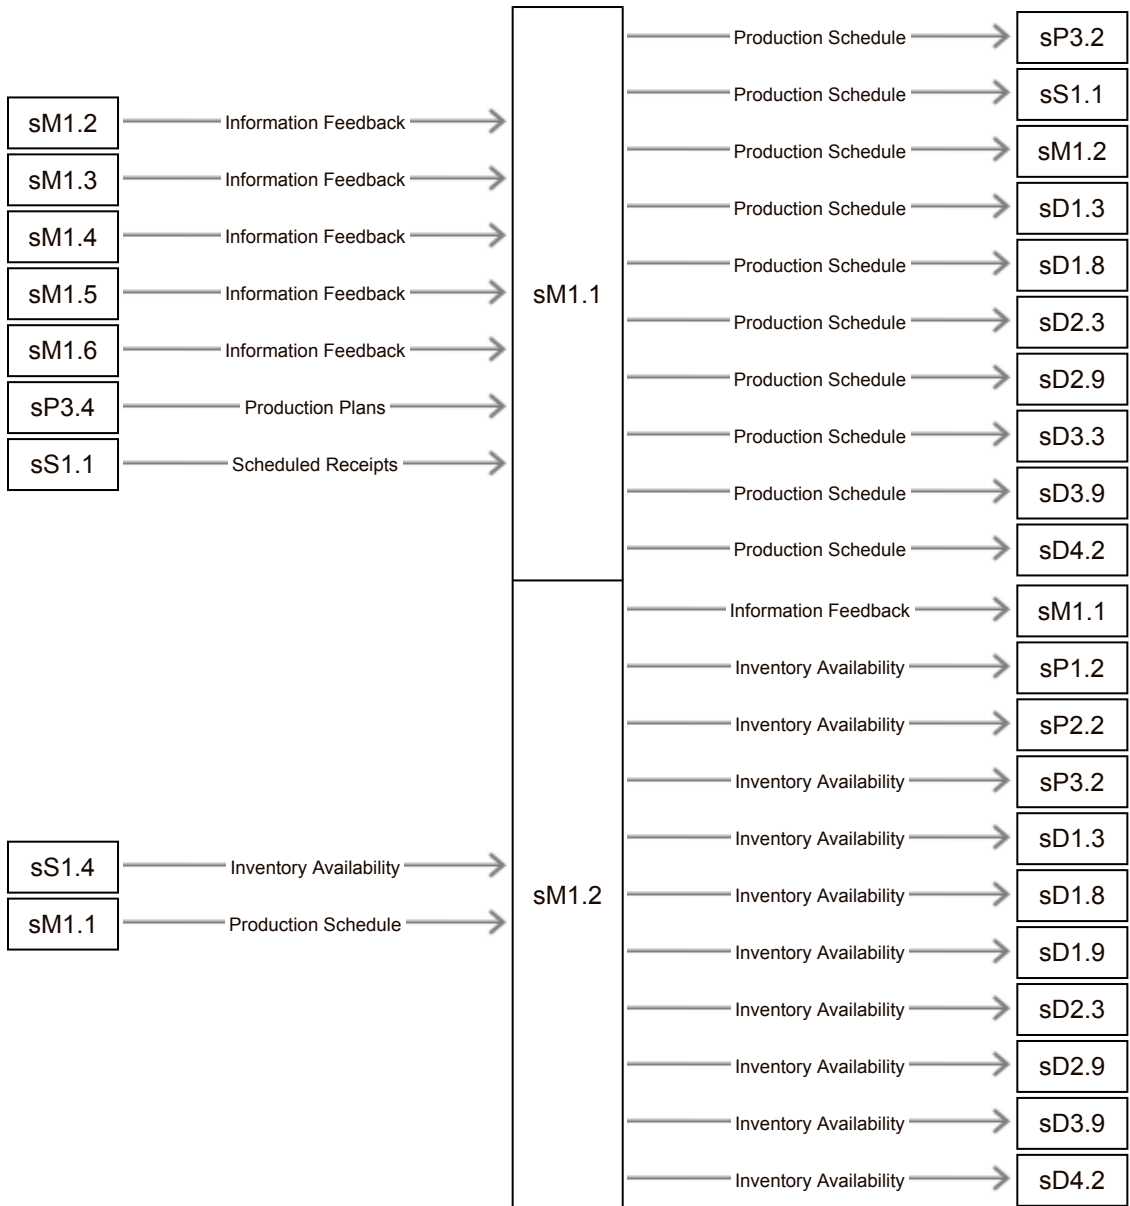

The process of manufacturing in a make-to-stock environment adds value to products through mixing, separating, forming, machining, and chemical processes. Make to stock products are intended to be shipped from finished goods or 'off the shelf', can be completed prior to receipt of a customer order, and are generally produced to a planned schedule in accordance with a sales forecast. No customer reference or customer order detail or specification is attached to production orders, attached to or marked on the product, or recorded in the shop floor management or ERP system for Make-to-Stock products.

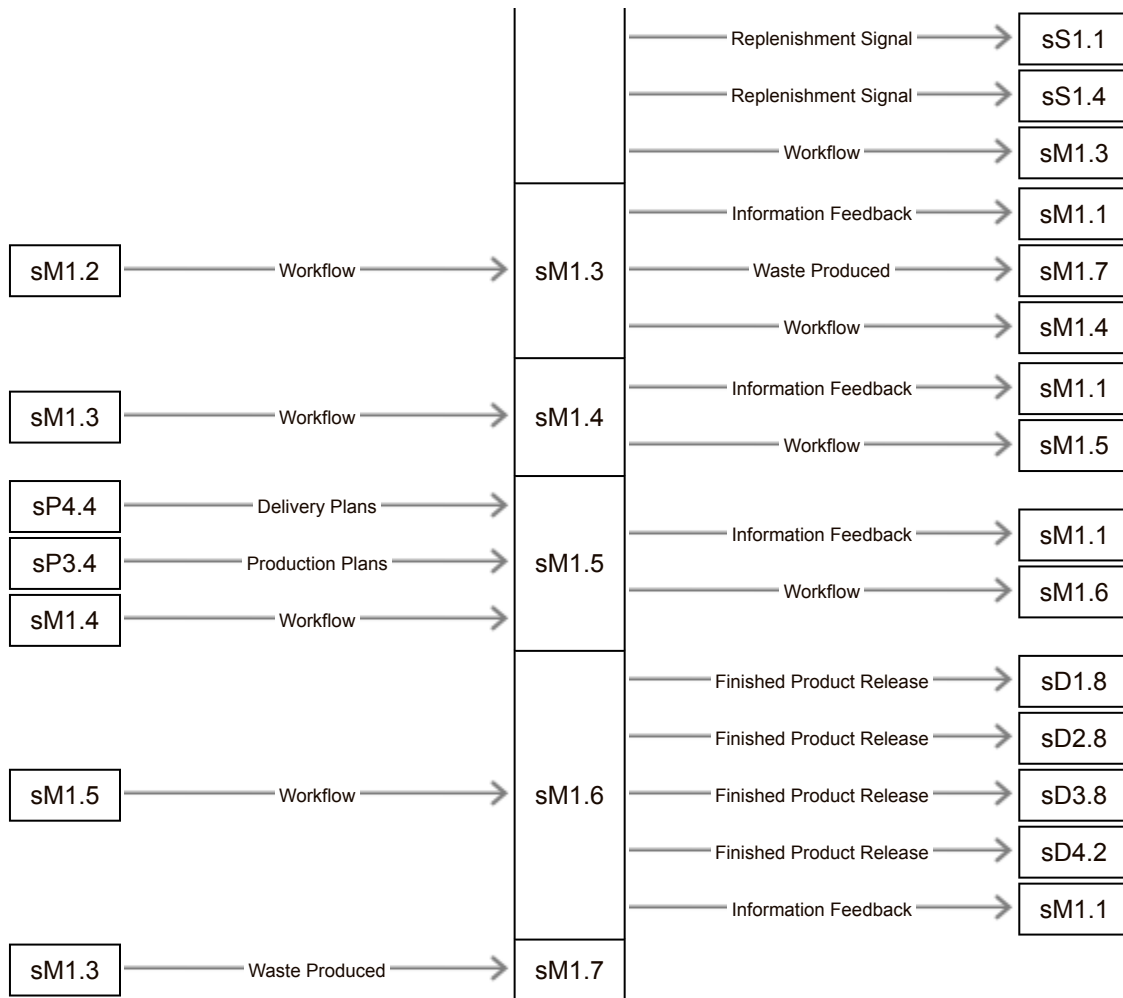

Hierarchy	
sM1.1	Schedule Production Activities
sM1.2	Issue Material

BP.098	Mobile Access of Information
BP.153	Bar coding/RFID

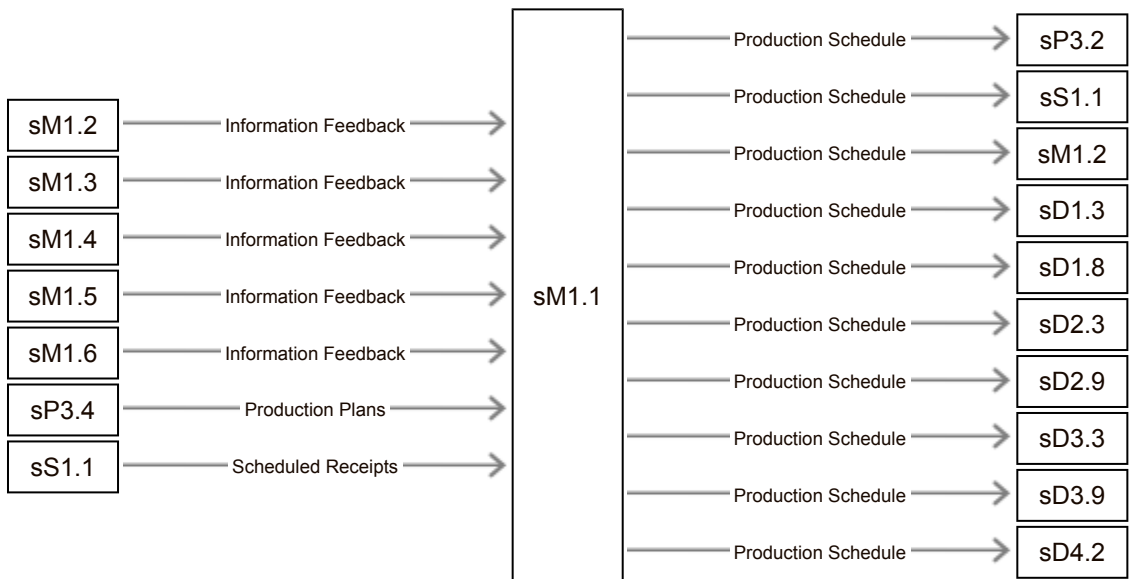

Workflow

Given plans for the production of specific parts, products, or formulations in specified quantities and planned availability of required sourced products, the scheduling of the operations to be performed in accordance with these plans. Scheduling includes sequencing, and, depending on the factory layout, any standards for setup and run. In general, intermediate production activities are coordinated prior to the scheduling of the operations to be performed in producing a finished product.

Metrics

Workflow

The process of manufacturing in a make-to-order environment adds value to products through mixing, separating, forming, machining, and chemical processes for a specific customer order. Products are completed, built or configured only in response to a customer order, the customer order reference is attached to the production order, attached to or marked on the product upon completion of the make process and referenced when transferring the product to Deliver. The product is identifiable throughout the Make process, as made for a specific customer order.

Examples of alternative or related names for Make-to-Order are: Build-to-Order (BTO), Assemble-to-Order (ATO), Configure-to-Order (CTO), and postponement.

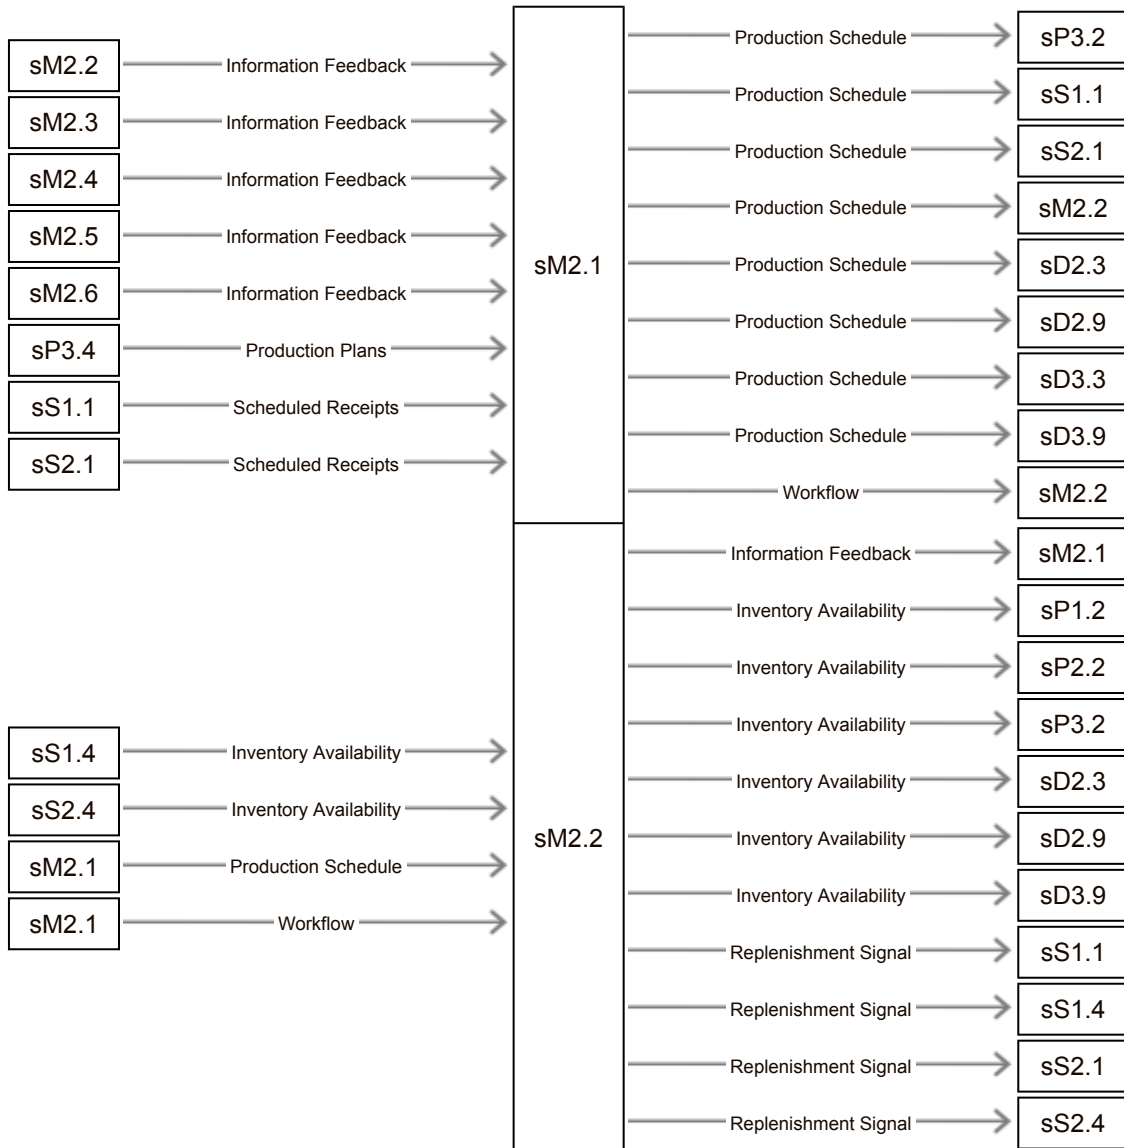

Hierarchy	
sM2.1	Schedule Production Activities
sM2.2	Issue Sourced/In-Process Product

Deliver

The processes associated with performing customer-facing order management and order fulfillment activities.

Hierarchy	
sD1	Deliver Stocked Product
sD2	Deliver Make-to-Order Product
sD3	Deliver Engineer-to-Order Product
sD4	Deliver Retail Product

Metrics	
CO.1.001	Total Cost to Serve
CO.2.005	Order Management Cost
CO.2.006	Fulfillment Cost

The process of delivering product that is sourced or made based on aggregated customer orders, projected orders/demand and inventory re-ordering parameters. The intention of Deliver Stocked Product is to have the product available when a customer order arrives (to prevent the customer from looking elsewhere). For services industries, these are services that are pre-defined and off-the-shelf (e.g. standard training). Products or services that are 'configurable' cannot be delivered through the Deliver Stocked Product process, as configurable products require customer reference or customer order details.

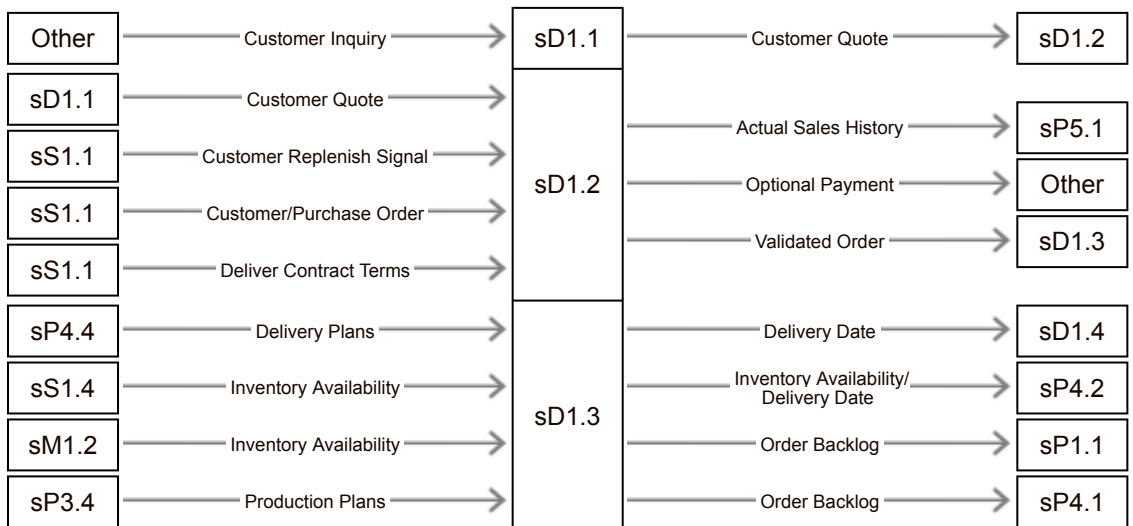

Hierarchy

Workflow

The processes of delivering product that is sourced, configured, manufactured, and/or assembled from standard raw materials, parts, ingredients or sub-assemblies, in response to a specific firm customer order. A reference to the customer order is exchanged with the sourcing or make process and attached to or marked on the product. Products in stock are identifiable by customer order through labeling and inventory data management. Examples include assigning a serial number, lot number or batch number to a customer order prior to Make or Source, processes that generate a bill-of-materials for the associated Make process (e.g. configure-to-order and assemble-to-order) and the 'special order' process in retail.

Hierarchy

Deliver Retail Products are the processes used to acquire, merchandise, and sell finished goods at a retail store. A retail store is a physical location that sells products (and services) direct to the consumer using a point of sale process (manual or automated) to collect payment. Merchandising at a store level is the stocking and restocking of products in designated storage locations to generate sales in a retail store.

The return of Maintenance, Repair and Overhaul (MRO) products or company assets for the purpose of servicing, repairing or upgrading it, as defined by Maintenance Plans or the occurrence or anticipation of risk of failure. Generally company assets managed through a MRO process are expected to be refurbished to a useable condition and returned to service. The Return process does not represent the actual maintenance, repair or overhaul activities; these are generally represented by Make processes. The physical disposition of the product may not be part of the return process.

Hierarchy

BP.126	Supply Chain Visibility System
BP.127	Automated Alerts for Material Management
BP.129	Return Policy included with Shipping Document

Workflow

The process where the designated return center receives an excess product return authorization request from a customer, determines if the item can be accepted and communicates their decision to the customer. Accepting the request would include negotiating the conditions of the return with the customer, including authorizing credit or cash discount. Rejecting the request would include providing a reason for the rejection to the customer.

Enable

The processes associated with establishing, maintaining and monitoring information, relationships, resources, assets, business rules, compliance and contracts required to operate the supply chain. Enable processes support the realisation and governance of the planning and execution processes of supply chains.

Enable processes interact with processes in other domains (for example: Financial processes, HR (Human Resource) processes, I(C)T (Information, Communication & Technology) processes, facilities management processes, product & portfolio management processes, product and process design processes and sales and support processes).

Hierarchy	
sE1	Manage Supply Chain Business Rules
sE2	Manage Performance
sE3	Manage Data and Information
sE4	Manage Supply Chain Human Resources
sE5	Manage Supply Chain Assets
sE6	Manage Supply Chain Contracts
sE7	Manage Supply Chain Network
sE8	Manage Regulatory Compliance

CO.2.005	Order Management Cost
CO.2.006	Fulfillment Cost
CO.2.007	Returns Cost

The process of establishing, documenting, communicating and publishing supply chain business rules. A business rule is a statement or parameter that defines or constrains some aspect of the business and is generally used in decision making. Business rules are intended to influence the outcomes of operating the supply chain. Business rules can apply to people, processes, corporate behavior and computing systems in an organization, and are put in place to help the organization achieve its goals.

An example business rule may state "no returns accepted without a return authorization". Types of supply chain business rules include:

- Performance goals
- Planning rules such as frequency, horizon and level of plans, planning BOMs
- Sourcing rules such as approved suppliers, blacklisted suppliers
- Manufacturing BOMs, equipment maintenance rules
- Approved transportation, warehousing and 3PL service providers, equipment calibration rules
- Product return policies, defective product disposition rules, refund/replacement rules

Note: sE1 Manage Business Rules generally does not develop policies, it translates policies into business rules applied to supply chain processes.

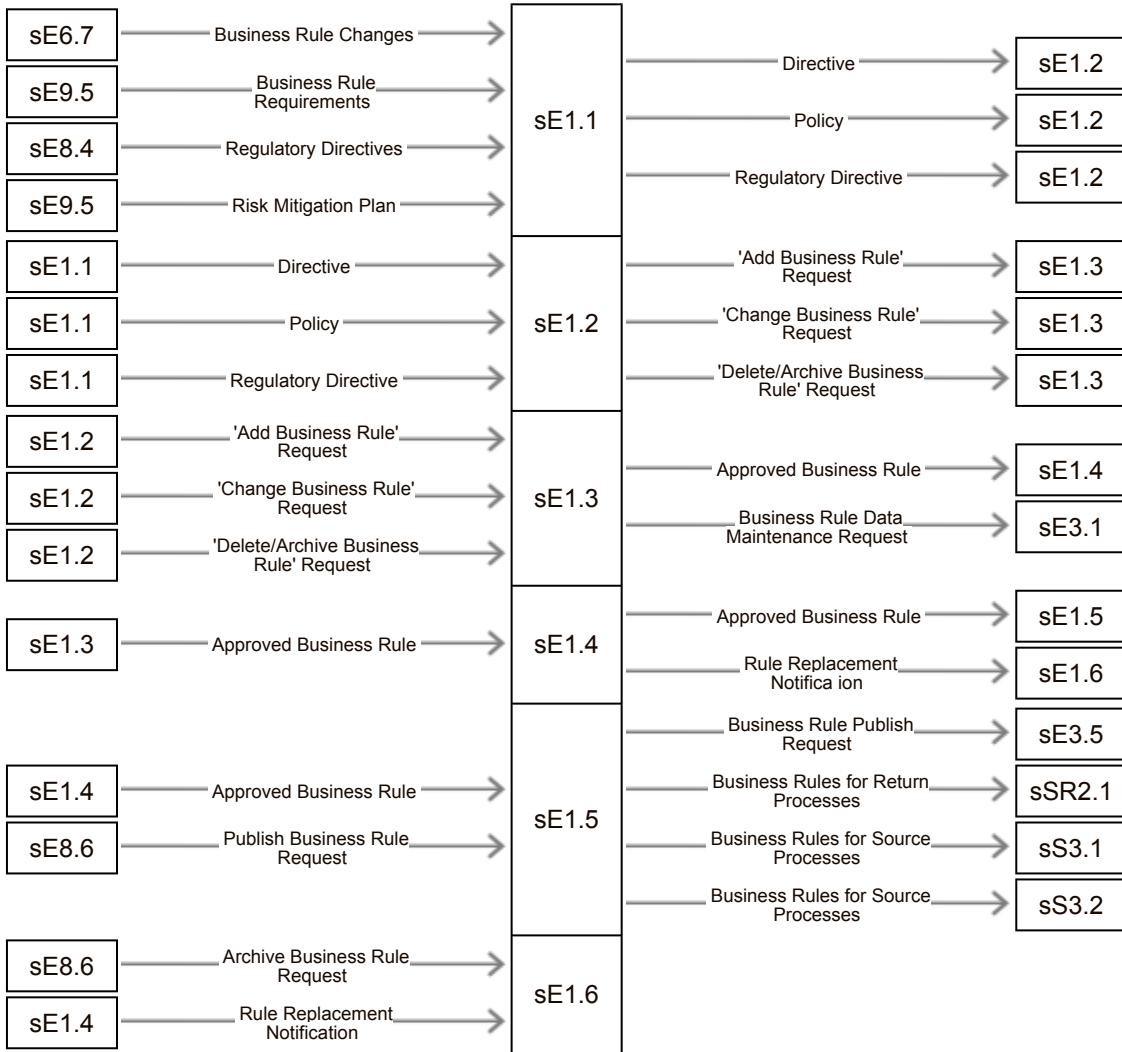

Hierarchy	
sE1.1	Gather Business Rule Requirements

HS.0149	Test Stand Operations

Workflow

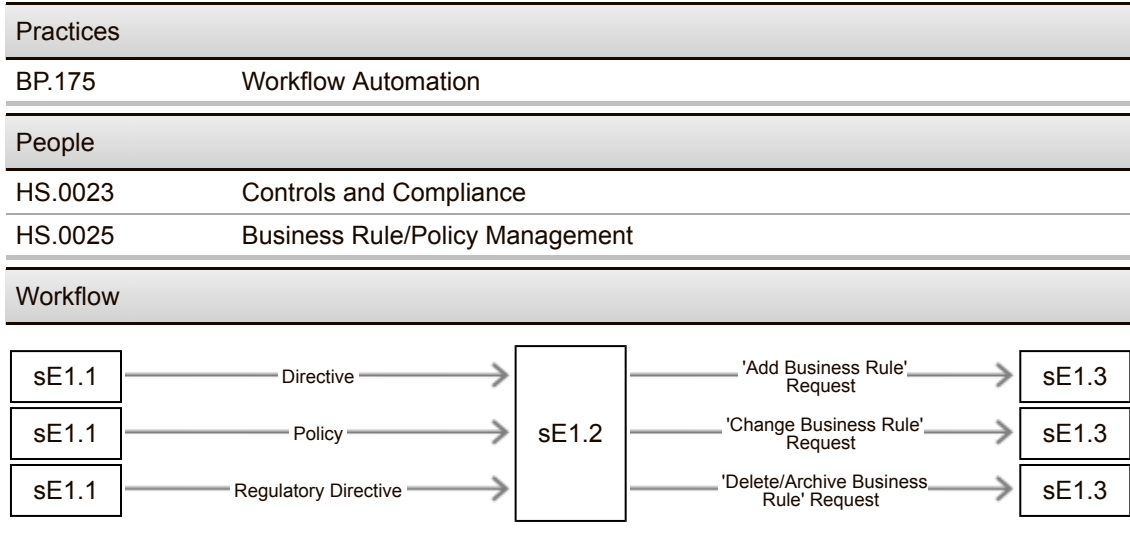

The process of collecting, organizing, prioritizing and scheduling policies and directives requiring new supply chain business rules, changes to business rules or discontinuation of business rules. This may include scheduling and assigning activities to responsible individuals, groups or organizations.

The process of determining how the policy or directive impacts supply chain processes, technology and business rules. This includes reviewing existing business rules and determining the need to add, change or delete business rules. The outcome is one or more of the following:

- Request to Add a Business Rule
- Request to Change a Business Rule
- Request to Delete or Archive a Business Rule

The purpose of this step is to identify the type of activities required and routing the request if required.

The process of writing the business rule in the appropriate system of record. This includes adding, editing and deleting policy and process documentation. A business rule includes a directive or policy, scope and effective date. Updates to existing business rules may include discontinuation information.

The final activity of Document Business Rule is obtaining formal approval. The output of this process step is a fully documented business rule that is signed off by the responsible function.

Practices

BP.166 Document Management System

BP.175 Workflow Automation

People

HS.0150 Total Quality Management (TQM)

HS.0157 Warranty process and policy

Workflow

The process of creating awareness in the relevant organization and/or staff of the upcoming changes. This may include communications, training and education programs. For small or incremental changes a notice maybe sufficient.

Practices

BP.166 Document Management System

BP.175 Workflow Automation

Workflow

The process of activating the business rule. Business rules release may be time-phased --e.g. Bill of Materials release for newer revisions. This may include activation of a business rule in a software algorithm and starting to use a new or updated standard operating procedure. For large impact business rule changes this may include updating external websites, formal announcements, etc.

Practices

BP.166 Document Management System

BP.175 Workflow Automation

Workflow

The process of de-activating the business rule. Business rules retirement may be time-phased --e.g. Bill of Materials replaced by newer revisions. This may include archiving the business rule in the associated software to avoid users from inadvertently using it or in order to comply to regulatory requirements or policies.

Practices

BP.166 Document Management System

BP.175 Workflow Automation

Workflow

The process of reporting performance, identifying gaps in performance, performing root cause analysis, and developing and launching corrective actions to close gaps in performance. This process describes all versions of managing supply chain performance. Example processes include:

- Inventory Cycle Counting
- Inventory reduction projects
- Order cycle time reduction efforts
- Production and process quality improvement programs
- Supplier performance assessments

Note: It is common for organizations to have multiple versions of this process in place, in different parts of the organization. At level-3 and 4, these processes may differ significantly depending on the objectives of each of these manage performance processes.

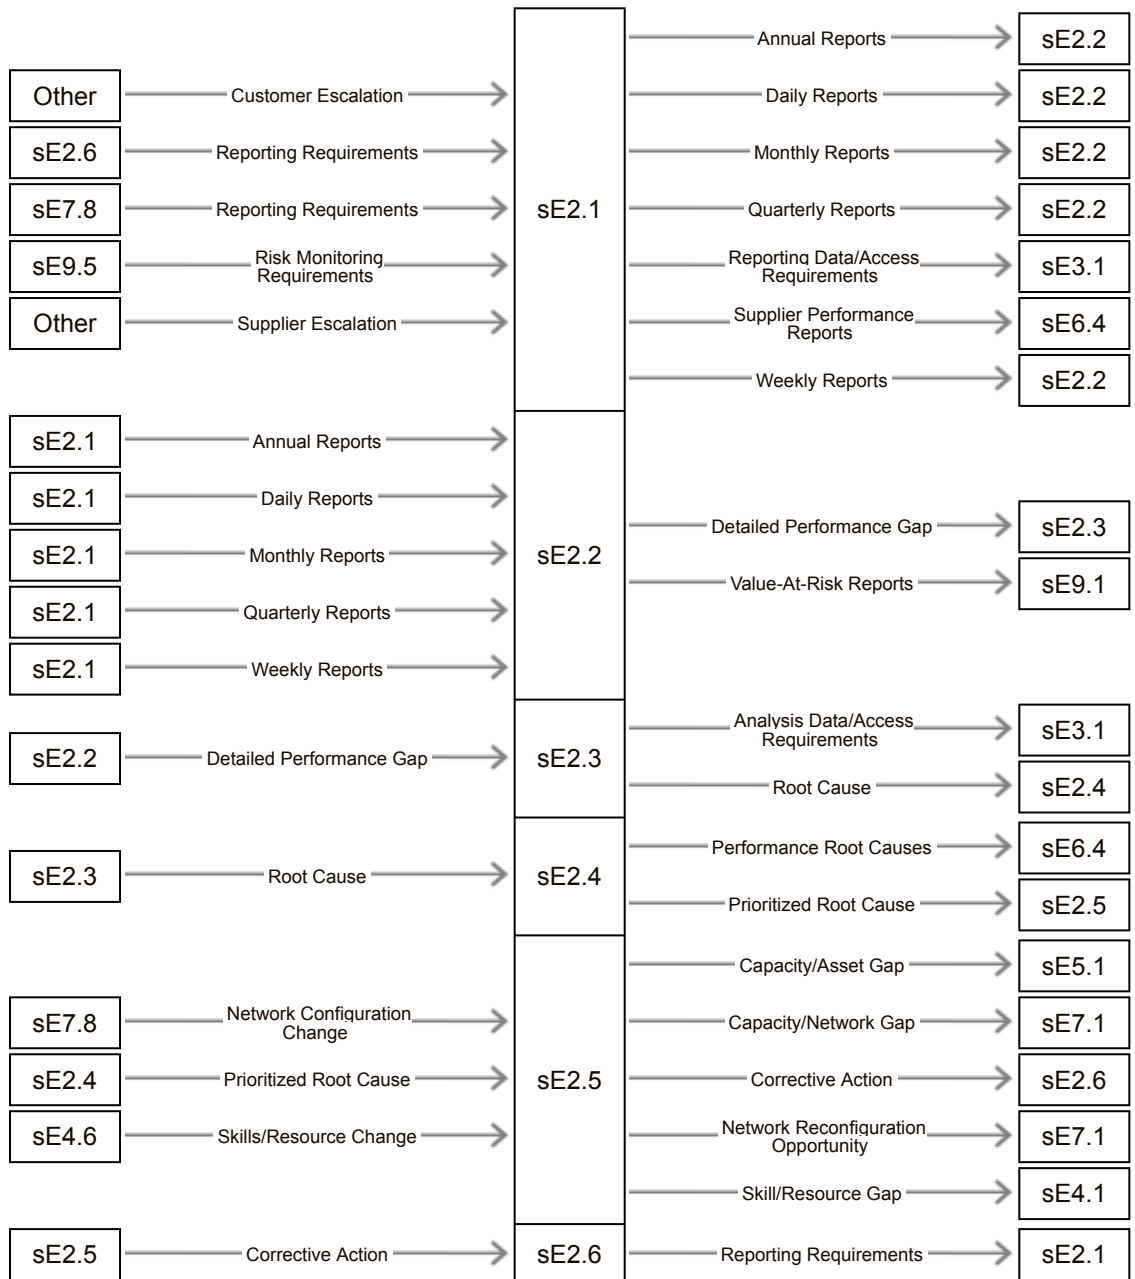

Hierarchy	
sE2.1	Initiate Reporting

HS.0072	Performance Management
HS.0082	Optimization
HS.0108	Quality Management
HS.0133	Six Sigma
HS.0142	Supply Chain Performance Measurements
HS.0150	Total Quality Management (TQM)

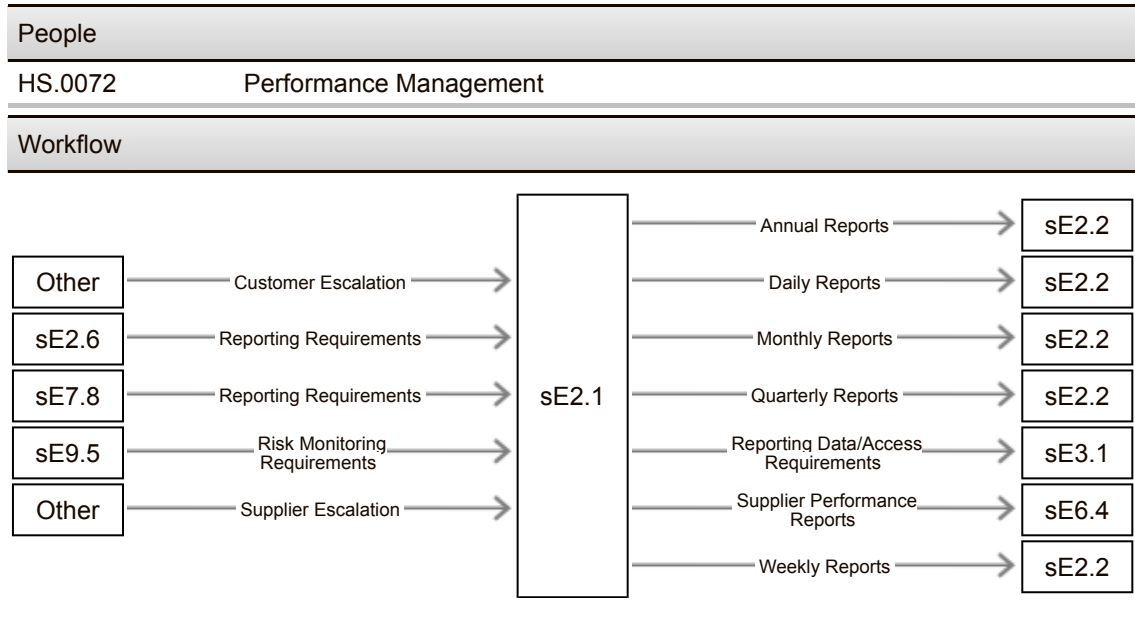

Workflow

The process of scheduling, running reports, collecting and aggregating performance data. This includes running standard (pre-defined) reports as well as adhoc reporting. Ad hoc reporting includes developing a data collection plan and organizing data collection through:

- Inspections
- Measurement (e.g. stopwatch to measure duration of activities)
- Sampling
- Self assessments (e.g. Baldrige Self Assessment)

Note: Today reports may be delivered (pushed) to the user by electronic media. This process step represents the delivery of reports to the user in such scenarios.

The process of reviewing the reported performance. This includes comparing actual performance and trends to targets set for each metric. Identify metrics that require root cause analysis and notification/scheduling of process owners or 'root cause analysis' resources.

People

HS.0072 Performance Management

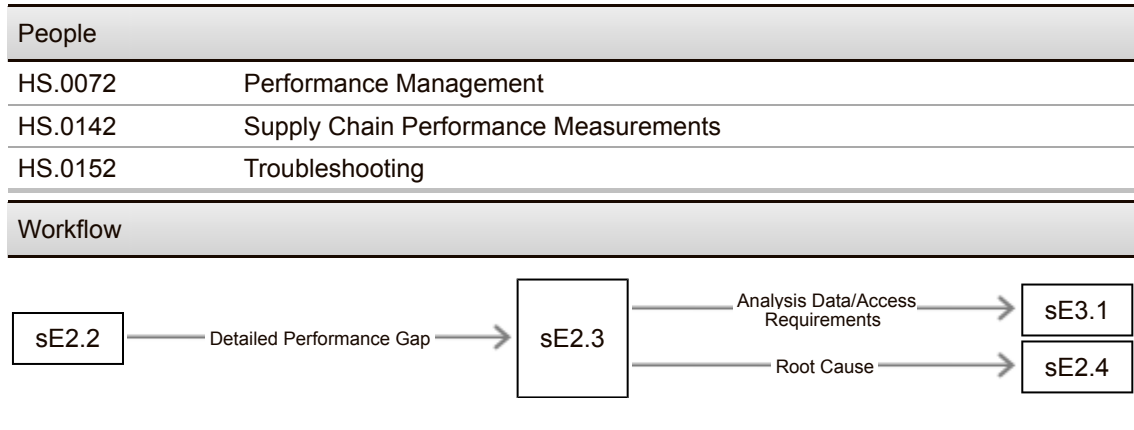

HS.0142 Supply Chain Performance Measurements

Workflow

The process of analyzing the gaps in performance. Example root cause finding methods and techniques include:

- Adding commentary to reported data
- Metrics decomposition using diagnostic relationships of (SCOR) metrics
- Time studies, sampling, audits, cycle counting
- 5-Whys/Cause & Effect analysis
- Statistical Analysis Techniques: e.g. Histogram, Scatter Plots, ANOVA

All root causes are documented and quantified. Quantification is the calculation or estimation of the relative contribution to the gap in performance.

The process of sorting root causes by relative contribution and prioritizing root causes. This includes assigning root causes to resources and scheduling development of corrective actions.

People

HS.0072 Performance Management

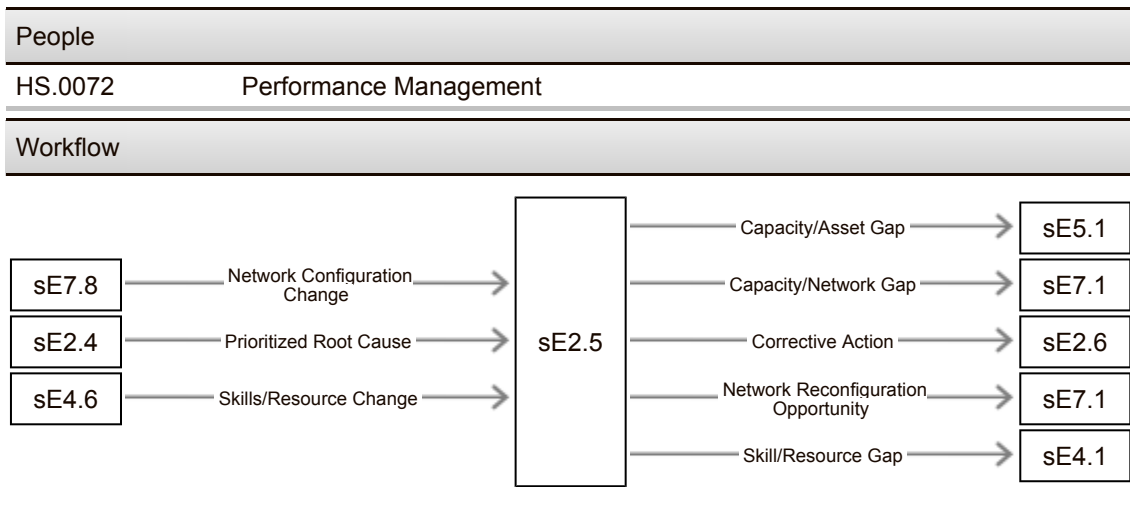

Workflow

The process of identifying, documenting and testing corrective actions to address the root cause in order to close the performance gap. Corrections actions include:

- Organizational changes (hiring, redeployment)
- Policy changes (business rules)
- Process improvements (work instructions, training)
- Production equipment repairs/calibration
- Supply chain network reconfiguration
- Software algorithm changes (e.g. planning or scheduling logic)
- Technology introduction (new equipment, tools, software)

Note: This list of corrective actions is a general characterization for example purposes only. Different root causes may require different corrective actions.

The process of obtaining approvals, prioritizing, communicating and launching the corrective actions.

People

HS.0072 Performance Management

Workflow

The process of collecting, maintaining and publishing data and information required to plan, operate, measure and manage the supply chain.

Examples of data elements include:

- Customer information - addresses, payment methods, customer pricing (pricelists), delivery methods
- Supplier information - addresses, whitelists, blacklists
- Product/service information - specifications, pricing,
- Network information - modal data, shipping lanes, routing,
- Process configuration information - planning parameters, planning BOMs, business rules

Activities include adding, changing and deleting (archiving) information, maintaining user access (grant, revoke) and maintaining availability of the information (activate/deactivate).

Notes: Alternative name: Master Data Management (e.g. Vendor Data Management, Product Master Data Management)

HS.0081	Office automation tools
HS.0098	Product Information Management (Product Data Management)

Workflow

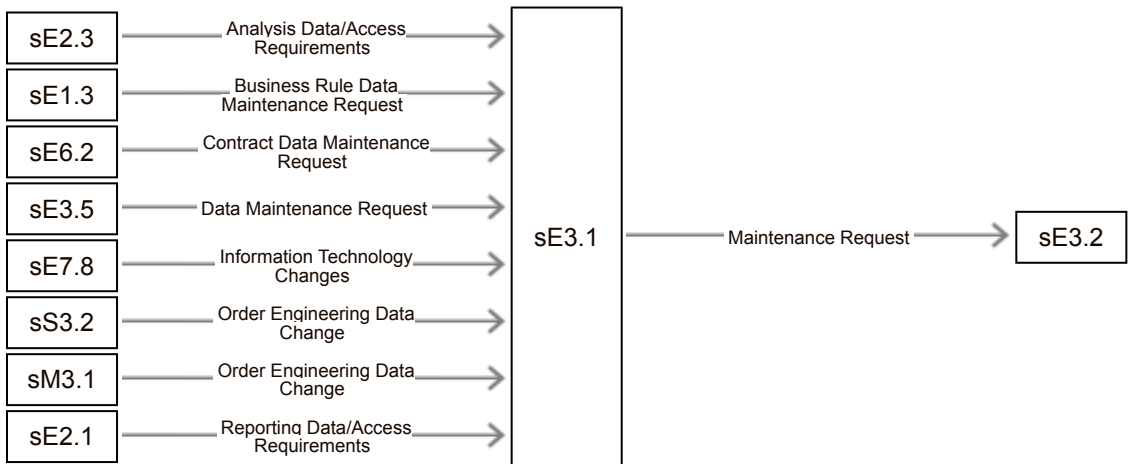

The process of receiving, validating and logging the request for information, configuration or system functionality maintenance. Maintenance request types:

- Add data - creation of new record/document (includes duplicating existing records/documents)
- Change data - modification of an existing record/document
- Delete data - deletion of an existing record (includes archiving and unpublishing existing records/documents)
- Change configuration (includes creating and maintaining user access)
- Add code - (includes installing software updates and security updates)
- Change code (modification of software code)
- Delete code

This process may include assigning a ticket, tracking or order number and routing the request to the appropriate resource.

Workflow

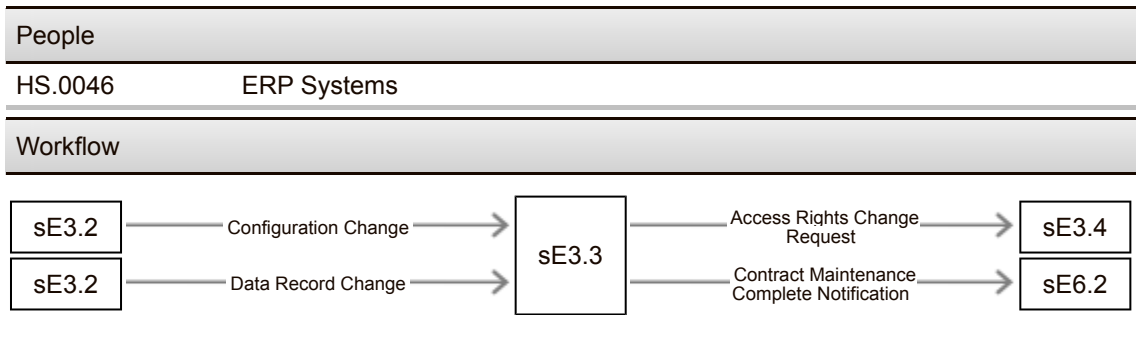

The activities associated with determining the activities required to perform the requested maintenance. The requestor may be contacted for additional information. Complex requests may be setup as projects with appropriate work breakdown structure, milestones, acceptance criteria and deliverable schedules. This process may include routing the request to the appropriate resource.

Workflow

The process of formatting, entering, loading, editing or deleting the information, software updates and code changes requested. This includes verification of changes as needed (unit and integration testing). Typical changes included are:

- Data record maintenance (such as bills-of-materials, shipping routes)
- Configuration (system parameter) changes (such as activating and disabling system functionality)
- Loading/installing software updates (e.g. code changes from vendors or development groups)
- Loading/installing security updates

This process is not a placeholder for complex software engineering processes. Such processes would lay outside of the SCOR process framework.

The process of establishing, changing or removing access rights for users.

The process of activating the changes to information, configuration and/or code and populating the information to dependent systems, where applicable. For data record maintenance this is the activation of the new data and populating dependent systems with the new data. For example activating a bill-of-materials (BOM) in the system-of-record* and populating the BOM to dependent systems that require a copy of this data. This process may be manual, automated or a combination.

*system-of-record = the information storage system, which is the authoritative data source for a given data element or piece of information.

Workflow

The process of verifying the information is properly recorded in the system of record and populated to dependent systems. This includes verifying information is accessible to users.

Workflow

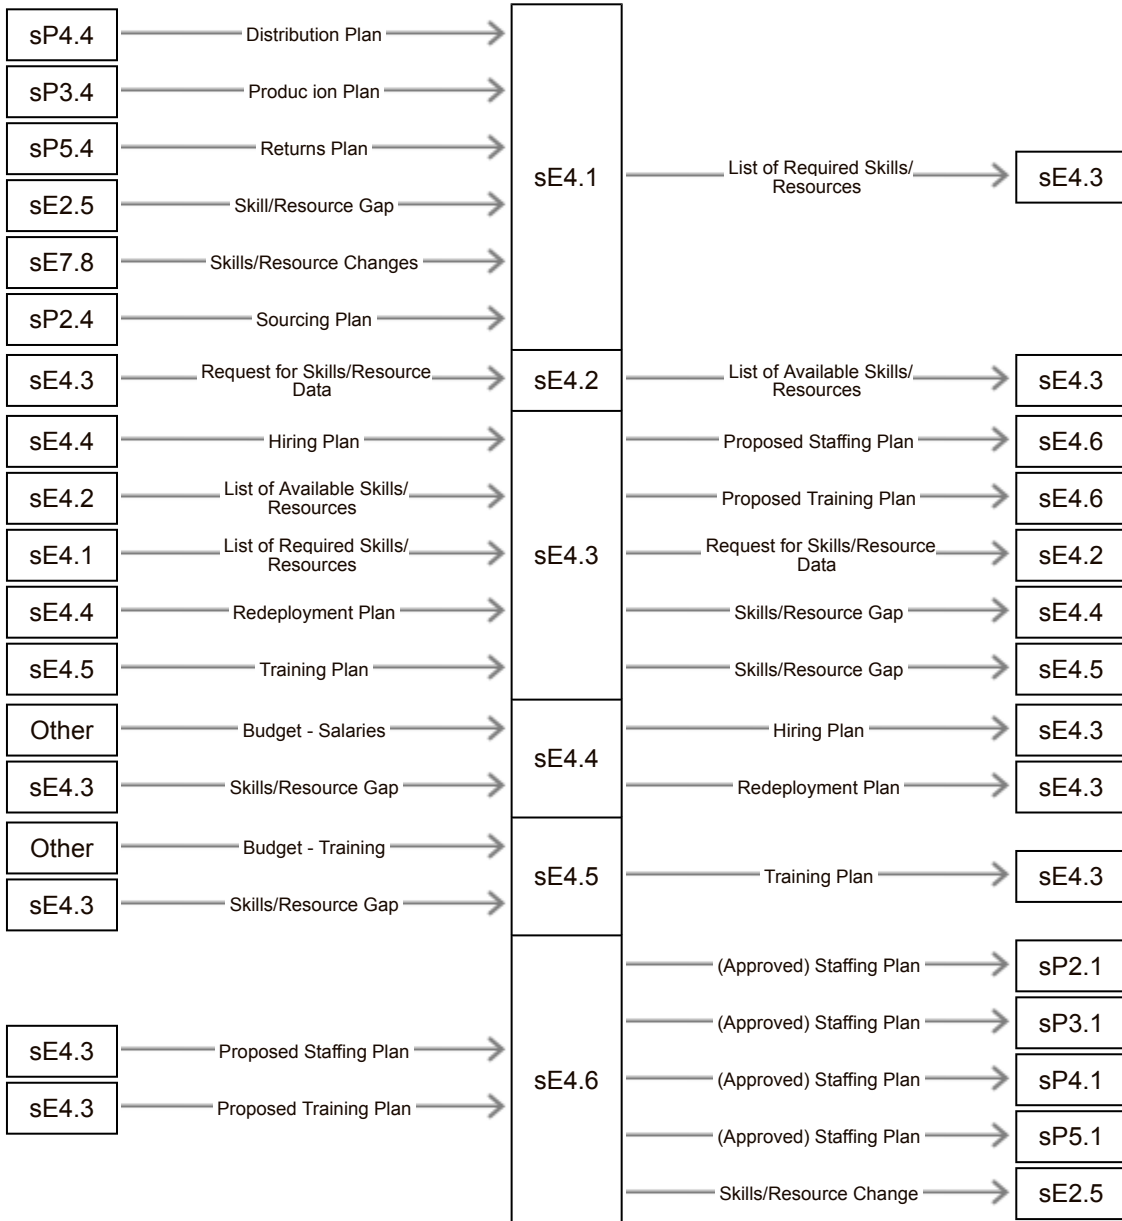

The process of developing, governing and maintaining an organization of permanent, temporary and outsourced staff, with the right qualifications, in support of the business objects and supply chain goals. This includes identifying required and available skills in the organization, determining gaps in skills and competency levels, identifying training needs, resource gaps and excess resources.

Note: This is a planning process to ensure staff (capacity) is available at the right levels. The actual training, hiring and redeployment is not part of this process as those are HR processes.

Hierarchy	
sE4.1	Identify Skills/Resource Requirement
sE4.2	Identify Available Skills/Resources

People	
HS.0022	Contract Management
HS.0041	EHS regulations
HS.0066	Legislation and Standards
HS.0072	Performance Management
HS.0085	Outsourcing

Workflow

The activities associated with the collection of the required skills to operate (part of) the supply chain. Examples of this process are planning meetings, periodic performance reviews, reorganizations. The data collected should list the required skills and/or number of resources and is generally organized by entity (supply chain node, department, function or a combination of these).

Workflow

The activities associated with the collection of skills/resources currently available in the supply chain. Generally this information is collected and organized by entity (supply chain node, department, function or a combination of these). Examples of this process include data collection for standard headcount reports, but should include temporary staff and outsourced resources.

Workflow

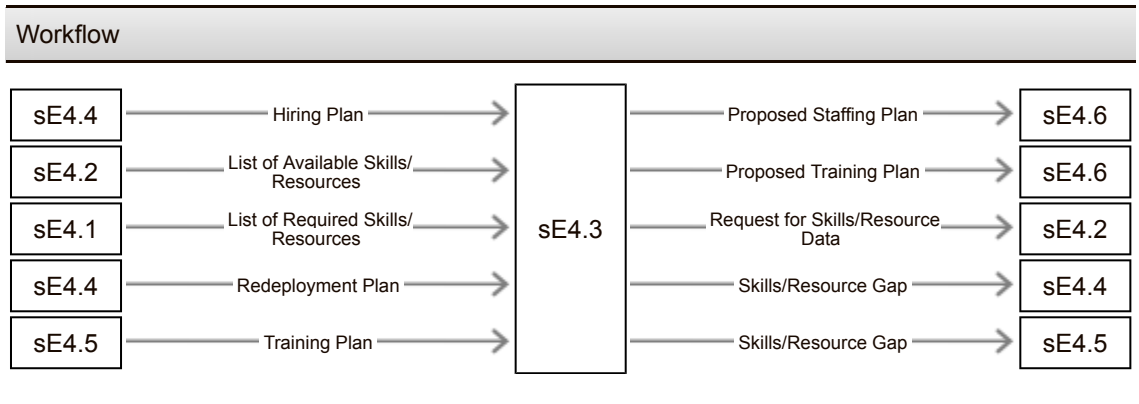

The activities associated with the matching of skills or resource demand with the available skills/resources. The purpose of this process is to determine which skill/resource requirements (demand) can be met using existing resources, determine which skill/resource requirements are not supported by current available skills/resources (gap) and determine the skills/resources for which no demand exists (excess).

For each skill/resource gap or excess, one or more actions need to be identified to close the gap or address the excess:

- Training/Cross-training (add skills to existing resources)
- Hiring (add resources with existing skills)
- Redeployment (moving staff to different organizations or layoff)

It is important to consider the lead-time of these actions, scarce skills may have longer leadtimes for example. Hiring includes temporary workers and all types of outsourced staff.

The activities associated with identification of sources of new hires or sources/destinations for redeployment. The purpose of this process step includes assessing the feasibility of hiring the required skills/resources within the required time period, assessing the feasibility of redeploying the excess employees (resources) and assessing the feasibility and impact of possible layoff of employees.

Note: At this stage this is a planning activity. The actual hiring process is not documented in SCOR as this is a Human Resources Management (HR) process. Employee in this context includes temporary workers and employees of service providers.

Workflow

The activities associated with the identification of training and education programs to ensure existing (and newly hired) employees will have the appropriate skills to perform the work allocated to each individual employee. Employee in this definition may include temporary workers and employees of service providers.

Workflow

The activities associated with obtaining approvals for hiring, redeployment, training and education plans, prioritizing and executing these plans. Additional resources and skills will become available over time, adjusting the labor component of capacity in Plan, Source, Make, Deliver, Return and/or Enable processes.

Workflow

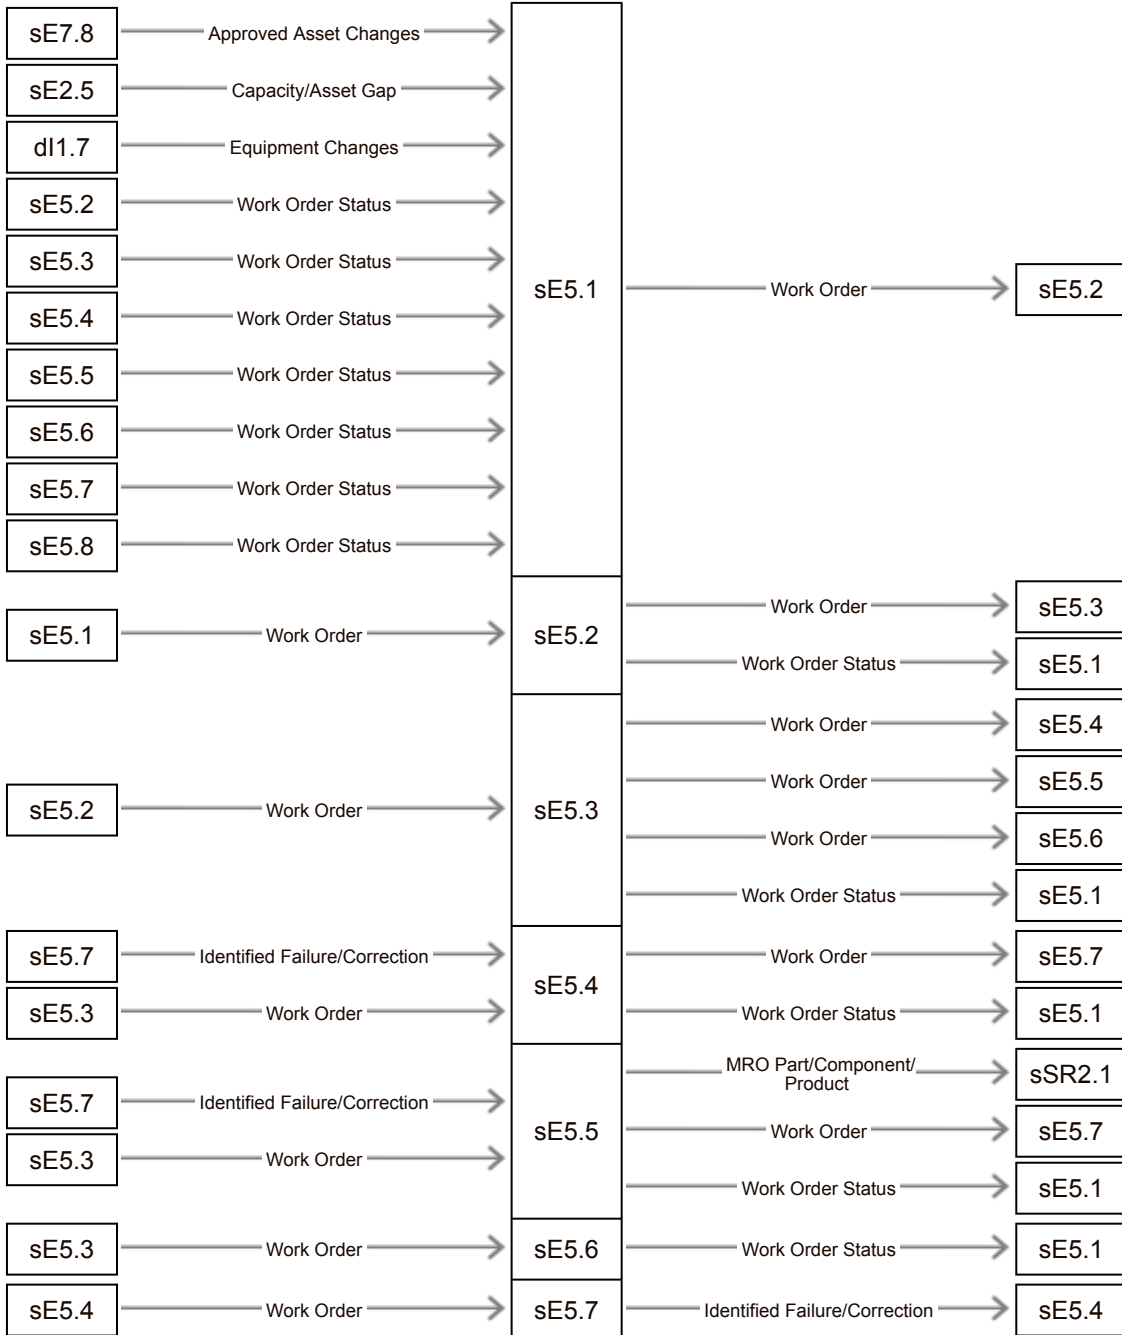

The process of scheduling, maintaining and dispositioning of supply chain assets that operate supply chain processes. This includes repair, alteration, calibration and other miscellaneous items to maintain production capabilities.

Discussion: This is more of a scheduling process to ensure assets (capacity) is available at the right levels at the right time. The actual maintenance, etc processes are described using standard SCOR processes. For example: The process to perform routine maintenance on a truck is described using Return MRO and/or Make processes.

The activities associated with completion of the maintenance work and preparing the equipment/asset to be brought 'on-line'. The general purpose of this process step is to make the asset available for 'production' (add to capacity). This includes closing work orders and receiving and approving payment of invoices for work performed by external resources. Upon completion of this process step the asset is expected to be in full working condition.

The management and communication of contractual agreements in support of business objectives and supply chain goals. This includes all contractual agreements related to supply chain operations, including: material acquisitions, contracts for services such as maintenance, temporary staff, IT services, transportation and lease of buildings and equipment, contract manufacturing, logistics service providers and customer contracts.

Notes: This covers former sES.10 and parts of sES.6, sEM.6, sED.6, sER.6. The identification and selection of suppliers and contract negotiations reside in DCOR processes (and partially in sS3). Customer pursuit and closing customer contracts reside in CCOR processes.

Hierarchy

Workflow

The activities associated with receiving new contracts or changes to existing contracts. These contract updates may originate in Sales & Support processes (customer contracts) or in Product and Process Design processes (for material supplier or services providers such as transportation services, equipment maintenance services, IT services). This includes validation of contracts against criteria (business rules). A contract needs to include information such as effective date and duration, customer or supplier address and payment terms and may not be in conflict with business rules (and regulatory requirements).

The activities associated with entering contractual information in document management systems and ERP systems. This includes the 'translation' of contractual language/information into a format that the system can comprehend. A final step in this process is to distribute the contract or updates to an existing contract to the appropriate processes/functions.

Practices

BP.166

Document Management System

Workflow

The activities associated with activation or de-activation and archiving the contract. This may include updating statuses of information in document management systems or ERP systems. This activity may be triggered and performed by the document management system or ERP system based on parameters entered as part of sE6.2 Enter and Distribute Contract.

Practices

BP.166 Document Management System

Workflow

The activities associated with reviewing the performance of contractual parties (both supplier and customer). This includes comparing the contractual service level agreements with the actual service levels. This process may be triggered by a calendar event - such as annual or quarterly quality reviews or actual performance issues identified in daily supply chain processes.

Practices

BP.131 Alternative Supplier Benchmarking

Workflow

The activities associated with identifying and prioritization of key performance issues or areas of ongoing process improvement. This includes notifying contractual partners of non-conformance to contractual agreements or agreed service level agreements. This process addresses both the non-compliance issues (severe) as well as areas of continuous improvement (non-severe, common interest).

Workflow

The activities associated with identifying ways to address the non-compliance or how to implement performance improvements. For non-compliance this process may have one or a combination of outcomes:

- Terminate the contract
- Pay/Collect Penalties
- Update contract (service levels, quality levels, terms and conditions)
- Continue as-is (internal process, policy or business rule changes)

Litigation or mediation may be considered in this process. Litigation or mediation is not part of supply chain processes.

The activities associated with selecting, obtaining approvals and prioritizing the appropriate issue resolution and distributing the resolution to the appropriate processes/functions.

Litigation or mediation may be the result of decisions made in this process. Litigation or mediation is not part of supply chain processes.

Workflow

The process of developing, governing and maintaining a network of supply chain assets (locations, plants, buildings, equipment, people and processes) that support the planning, sourcing, making, delivery and returning of products and services in support of the business objectives and supply chain goals.

HS.0082	Optimization
HS.0085	Outsourcing
HS.0093	Prioritization
HS.0141	Supply Chain Management
HS.0142	Supply Chain Performance Measurements

Workflow

The activities associated with determining what part of the supply chain network will be assessed (the scope). Organizations that manage the supply chain network as a project structure will need to establish a project organization. Organization selection includes identification and securing availability of sponsor, stakeholders and data/information providers as well as selecting project team members.

Workflow

The activities associated with identification of the objective of the supply chain ('what strategy does the supply chain need to support') and collection of data required to describe (model) the supply chain at the required level. Data collected includes: facilities costs, capacity and locations, transportation cost, capacity and lead times, customer volumes, order frequency and size and customer locations.

People

HS.0033 Data management

HS.0072 Performance Management

Workflow

The activities associated with the development of scenarios (what-if) in support of different strategies and projections. Scenarios may be developed for different detailed strategies, requirements and potential internal/external changes. Activities include management interview, external transportation and warehousing studies. Initial review of developed scenarios may result in rejection of the scenario or proceeding to simulation.

People	
HS.0082	Optimization
HS.0085	Outsourcing

Workflow				
sE7.2	Project Charter	sE7.3	Defined What-if Scenario	sE7.4

The activities associated with the development of models and/or simulation models to run 'what-if' scenarios through a validation process. Simulation models may use automation, but conference room pilots or walk-throughs may also serve this purpose. The purpose of simulation is to validate feasibility of each scenario and find possible network/process design flaws. Automated simulation tools may also predict the performance of the new network/processes by simulating the processing of large numbers of orders.

People

HS.0082

Optimization

Workflow

The activities associated with estimating the effort, risks, results of implementing the scenario. Effort includes the estimating the risks and duration and the funding, staffing and skills required for implementing the scenario. Risks includes estimating the impact on the Value-at-Risk for the supply chain. Results includes determining the changes to the performance of the supply chain on all relevant metrics.

People	
HS.0003	Accounting
HS.0126	Risk Identification
HS.0127	Risk Mitigation

Workflow				
sE7.4	Tested What-if Scenario	sE7.5	Documented Change Proposals	sE7.6

The activities associated with recommending and obtaining approvals for proposed supply chain network/configuration changes. This includes reviewing the 'what-if' scenarios and impact/benefit results with key stakeholders. The objective of this process is to identify the optimal solution and present this recommendation to sponsor and stakeholders and obtain approval to develop network change program.

Workflow

The activities associated with developing the roadmap for change. This includes identifying the steps (or projects) required to implement changes to facilities, contracted parties, staffing, automation and process. Specific changes are assigned to unique owners. This includes reviewing the specific change/projects with key stakeholders. The objective of this process is to obtain approval to launch change projects.

Workflow

The activities associated with coordinating, starting and monitoring the individual change projects. This includes support the establishment of change projects, coordinate launch dates and communicate reporting requirements. Steps may include archiving the supply chain network/configuration project documentation for future reference and dissolving the project team. Dissolving the project team requires transfer of responsibilities to monitor progress to appropriate organizations.

 People

 HS.0105 Project Management

 Workflow

The process of identifying, collecting, assessing and integrating regulatory compliance requirements in standard supply chain processes, policies and business rules.

Regulatory Compliance is the term generally used to describe the policies and processes which organizations have in place to ensure that they comply with laws, rules and regulations put in place by external bodies (government) which control activity in a given jurisdiction. A key component of Regulatory Compliance is establishing policies, business rules and processes to ensure legislative and regulatory compliance requirements are met. This includes ensuring personnel are aware of and take steps to comply with relevant laws and regulations and data or records retention used for compliance validation. Examples include: C-TPAT, Hazardous Materials, Import/Export, Labor, Licensing, Taxes. Note: These are examples, SCOR does not (attempt to) provide a complete list.

Hierarchy

sE8.1	Monitor Regulatory Entities
sE8.2	Assess Regulatory Publications
sE8.3	Identify Regulatory Deficiencies
sE8.4	Define Remediation
sE8.5	Verify/Obtain License
sE8.6	Publish Remediation

Metrics

RS.3.61	Manage Import/Export Requirements Cycle Time

HS.0054	Intellectual Property/Proprietary Data
HS.0066	Legislation and Standards
HS.0111	Regulatory Policy Management
HS.0157	Warranty process and policy
HS.0160	Waste Management

Workflow

The activities associated with identification regulatory publications, subscribing to publications, receiving and registering publications of relevant regulatory entities (e.g. government agencies).

The activities associated with reading, interpreting and researching policies, laws, rules and regulations. This includes determining if and how these regulatory requirements apply to the supply chain.

Workflow

The activities associated with identification of past, current and future regulatory requirements that are not or can not be met using existing processes, business rules and policies. This includes notification of deficiency status to impacted organizations.

Workflow

The activities associated with identification remediation alternatives, selecting and documenting processes, policies and business rules and setting documentation requirements to remediate a deficiency.

Workflow

The activities associated with verification of the remediation strategy with controlling entities and/or obtaining a license certifying compliance by the controlling entity.

The activities associated with approving and implementing changes to processes, policies and business rules. This may include distributing certification documentation to relevant organizations in the supply chain.

The process of identification and assessment of potential disruptions (risks) in the supply chain and developing a plan to mitigate these threats to operating the supply chain. Supply chain risks include:

- Disruptions in demand - e.g. customers going out of business
- Disruptions in supply - e.g. suppliers going out of business, supplier quality/performance issues
- Environmental disruptions - e.g. weather, flooding, earthquakes
- Financial disruptions - e.g. availability of credit, investors
- Fraud, theft and mismanagement - lack of risk mitigation
- Labor disruption - e.g. employee strikes, availability of qualified staff
- Terrorism and cyber attacks

Risk mitigation strategies include avoiding the risk, reducing the impact or probability of the risk, transferring the risk to another party and accepting part of the risk. Example changes to the supply chain network, process and resources include: insurance, relocation, dual/triple sourcing, outsourcing, insourcing, offshoring, reshoring, security, supply chain redesign, process redesign, business rule changes, contract renegotiation.

sE9 Manage Supply Chain Risk is closely aligned with section 5 of the ISO 31000 standard. ISO 31000 is a generic risk management standard accross the enterprise, sE9 - Manage Supply Chain Risk is the adaptation for supply chain risk management. Note: ISO 31000 section 5.6 Monitor and Review is represented in SCOR as sE2 Manage Supply Chain Performance.

HS.0125	Risk Assessment
HS.0126	Risk Identification
HS.0127	Risk Mitigation
HS.0128	Risk Response Planning
HS.0142	Supply Chain Performance Measurements

Workflow

The process of defining and documenting the objectives and scope (internal and external) for managing risk. This includes developing/maintaining understanding of the internal and external relationships, internal and external factors that influence the supply chain's ability to achieve it's objectives, and defining and maintaining a risk management organization -- stakeholders, governance structure, procedures and schedule.

Metrics	
AG.2.15	Value at Risk (Plan)
AG.2.16	Value at Risk (Source)
AG.2.17	Value at Risk (Make)
AG.2.18	Value at Risk (Deliver)
AG.2.19	Value at Risk (Return)
Practices	
BP.001	Supply Chain Risk Management (SCRM)
BP.081	Bowtie Risk Management
People	
HS.0124	Risk and exception management
Workflow	

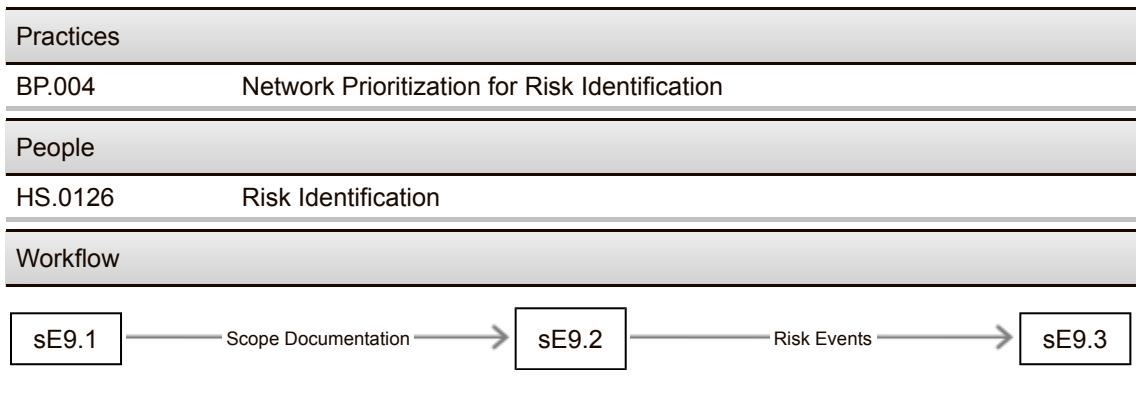

The process of identifying, collecting and documenting all potential risk events that may impact the organization from meeting its goals. This includes identification of sources of risks, identification and discovery of risk events.

This process generates a comprehensive list of all risks that may disrupt the supply chain, including information which processes in the supply chain will be directly and indirectly impacted by the occurrence of the risk event. A broad classification of risk types includes:

- Disruptions in demand - e.g. customers going out of business
- Disruptions in supply - e.g. suppliers going out of business, supplier quality/performance issues
- Environmental disruptions - e.g. weather, flooding, earthquakes
- Financial disruptions - e.g. availability of credit, investors
- Fraud, theft and mismanagement - lack of risk mitigation
- Labor disruption - e.g. employee strikes, availability of qualified staff
- Terrorism and cyber attacks

The number of risks within these types may differ by industry.

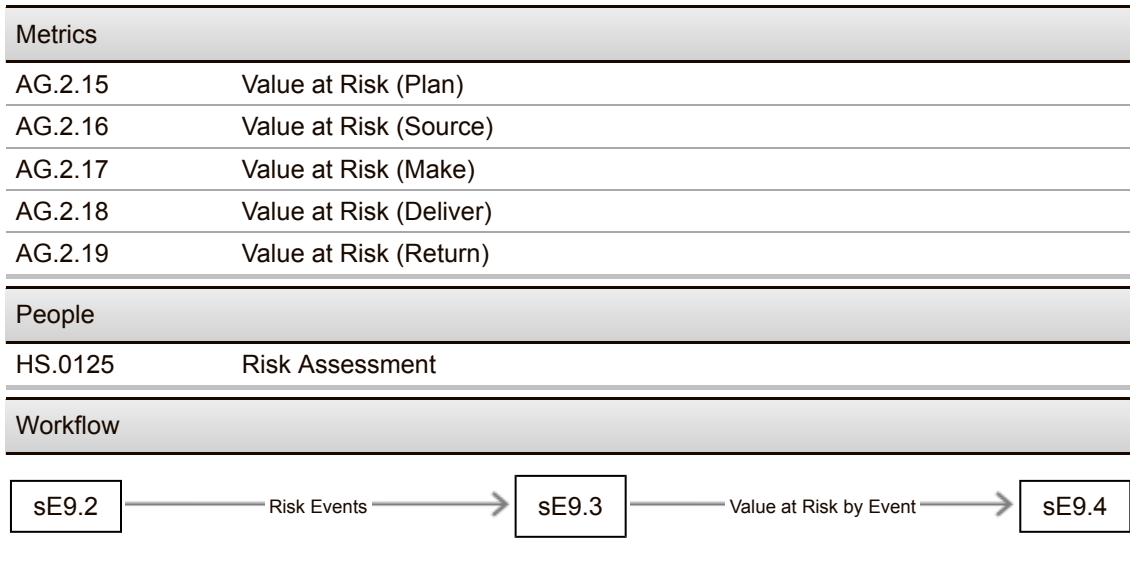

The process of collecting and documenting for each potential risk the causes, probability and consequences. The standard metric for quantification of risk is Value at Risk (VaR):

$$\text{VaR} = \text{Probability of Occurance} \times \text{Monetary Impact of Occurance}$$

This process generates a comprehensive list of the monetary impact for all risks that may disrupt the supply chain. For certain types of risk events probability information may be available through government agencies, insurance companies or research firms. The monetary impact is determined based on the projected monetary impact for each supply chain for each risk event. For example:

- For a single sourced material the supplier going out of business means the product manufactured using this material can not be produced until a new supplier has been identified, qualified and integrated in the supply chain. The monetary impact would be the loss of the projected revenue for these products during the qualification and integration process of a new supplier.
- For a dual sourced material one of the two suppliers going out of business means the product manufactured using this material can only be produced for the percentage the remaining supplier may be able to support until a new supplier has been identified, qualified and integrated or until the remaining supplier can support 100% of the project revenue.

Different risk events may have different monetary impacts: reduction of revenue vs. increase of cost.

The process of prioritizing risk events by VaR and determining for each risk whether mitigation actions are required or the risk is acceptable ('risk of doing business').

Practices

BP.004 Network Prioritization for Risk Identification

BP.081 Bowtie Risk Management

Workflow

The process of determining the actions required to eliminate, reduce or accept and monitor the risks - creating, approving, communicating and launching the 'Risk Mitigation Plan'.

Practices

BP.002 Risk Management Strategies

Workflow

Section 3

Practices

Introduction to Practices

A practice is a unique way to configure a process or a set of processes. The uniqueness can be related to the automation of the process, a technology applied in the process, special skills applied to the process, a unique sequence for performing the process, or a unique method for distributing and connecting processes between organizations. All practices have links to one or more processes, one or more metrics and where available one or more skills.

Qualification of Practices

SCOR recognizes that several different types of practices exist within any organization:

- Emerging practices
- Best practices
- Standard practices
- Declining practices.

These practice categories go by other names as well. What's important to understand is that different practices have different performance expectations. The classification of a practice will vary by industry. For some industries a practice may be standard, whereas the same practice may be considered a emerging or best practice in another industry. The SCOR classification of practices has been established based on input from practitioners and experts from a diverse range of industries.

Emerging practices

Emerging practices introduce new technology, knowledge or radically different ways of organizing processes. Emerging practices may yield a step change in performance by 'redefining the playing field' within an industry. Emerging practices may not be easy to adopt because of proprietary technology, or special knowledge may prevent wider adoption. Emerging practices generally have not been proven in a wide variety of environments and industries.

Risk: High, Results: High.

Best practices

Best practices are 'current', 'structured' and 'repeatable' practices that have had a proven and positive impact on supply chain performance.

- Current: Not emerging, not outmoded.
- Structured: Feature a clearly stated goal, scope, process, and procedure.
- Proven: Demonstrated in a working environment, and linked to key metrics.
- Repeatable: Proven in multiple organizations and industries.

SCOR best practices have been chosen by SCOR practitioners in diverse industries. It is understood that not all best practices will yield the same results for all industries or supply chains.

Risk: Moderate, Results: Moderate.

Standard practices

Standard practices are how a wide range of companies have historically done business by default or happenstance. These well established practices do the job, but don't provide a significant cost or competitive advantage over other practices (except over declining practices).

Risk: Low, Results: Low.

Declining practices

Declining practices represent ways of doing business, which can be widespread, that have proven to result in poor supply chain performance as indicated by key metrics.

Risk: High, Results: Negative.

Classification of Practices

All practices in SCOR have been classified to simplify finding a practice. The table below shows the classification categories for the SCOR practices. A practice may be linked to multiple categories. For example: The Self-Invoicing practice is listed in Purchasing and Transportation Management as the practice can be applied materials suppliers and transportation and other service providers.

Categories	
Business Process Analysis/Improvement	Planning and Forecasting
Customer Support	Product Lifecycle Management
Distribution Management	Production Execution
Information/Data Management	Purchasing/Procurement
Inventory Management	Reverse Logistics
Material Handling	Risk/Security Management
New Product Introduction	Sustainable Supply Chain Management
Order Engineering (ETO)	Transportation Management
Order Management	Warehousing
People Management (Training)	

The practices listed in SCOR are for identification purposes only. Further research and analysis is generally required to fully understand how to implement a practice. For example: SCOR recognizes S&OP as a practice and lists which processes and metrics may be impacted. For detailed process and implementation design an organization will need to consult other sources -- such as books, case studies, seminars, consultancies. Some practices may be registered by other organizations. SCC does not claim ownership of these practices but merely recognizes their relevance and value. All practices are copyright of their respective owners. Many practices are in the common domain.

Practices by Classification

Business Process Analysis/Improvement

Automated Data Capture (ADC)	BP.152
Business Rule Management	BP.023

Emerging Practices

Emerging practices introduce new technology, knowledge or radically different ways of organizing processes. Emerging practices may yield a step change in performance by 'redefining the playing field' within an industry. Emerging practices may not be easy to adopt because of proprietary technology, or special knowledge may prevent wider adoption. Emerging practices generally have not been proven in a wide variety of environments and industries.

Investment, Risk: High, Results: High.

Demand Planning & Forecasting: Use state-of-the-art forecasting algorithms for product life-cycle planning and trade promotion planning.

Understanding and predicting customer demand is vital to manufacturers and distributors to avoid stock-outs and maintain adequate inventory levels. While forecasts are never perfect, they are necessary to prepare for actual demand. In order to maintain an optimized inventory and effective supply chain, accurate demand forecasts are imperative together with the most advanced algorithm. The algorithms are the core of the demand and supply management solutions. It is what makes it possible to seamlessly work at any level of aggregation and along any dimension like product, channel or customer with ease and performance yet without rigid 'forecast pyramids.'

Success measurement: Forecast accuracy in the supply chain is typically measured using the Mean Absolute Percent Error or MAPE. Statistically MAPE is defined as the average of percentage errors. Most practitioners, however, define and use the MAPE as the Mean Absolute Deviation divided by Average Sales. This is in effect a volume weighted MAPE. This is also referred to as the MAD/Mean ratio.

A simpler and more elegant method to calculate MAPE across all the products forecasted is to divide the sum of the absolute deviations by the total sales of all products.

Simulate and implement comprehensive tactical planning and sourcing decisions based on a single, globally consistent model.

The Supply Network Planning enables organizations to create a very close match between supply and demand by integrating purchasing, manufacturing, distribution, and transportation into one consistent model. By modeling the entire supply network and related constraints, it makes it possible to synchronize activities and plan material flow throughout the entire supply chain. The results are feasible plans for purchasing, manufacturing, inventory, and transportation.

The process also includes enabling organizations to dynamically determine how and when inventory should be distributed. The supporting system optimizes deployment plans based on available algorithms, as well as user rules and policies.

Demand Management takes Demand Planning to the next level and integrates the plan up and down the supply chain as well as across the enterprise. It takes a holistic view of a multi-unit enterprise, its markets, and its trade partners capabilities. Using sophisticated software tools and web technologies, supply chain managers are able to aggregate demand, manage inventories and respond in near real time to changes in demand. Multiple, real time applications are used within a Demand Management process to analyze and evaluate changes in demand and the impact on supply.

Centralized systems and applications, capable of receiving, monitoring and processing information in real time from various business unit ERPs is used in the Demand Management process. These applications are O/S and ERP application agnostic and can operate as part of the enterprise IT infrastructure or as a SAAS application.

Business Rules Management is the practice where business rules are in a (human-readable) form that are used by, but not embedded in, supply chain systems. The business rules should be visible, easily modified by nonprogrammers, and usable by any application and channel. Business Rules Management formalizes a supply chain's critical business rules in a language that business and IT staff understand. Business rules are established to help an organization achieve its goals and are an unambiguous statement to support decision making. The formal specification of a business rule becomes information for process and rules engines to run.

Categories of business rules. A statement of a business rule falls into one of four categories:

- Definitions of business terms - The most basic element of a business rule is the language used to express it. The very definition of a term is itself a business rule that describes how people think and talk about things. Thus defining a term is establishing a category of business rule. Terms have traditionally been documented in glossaries or as entities in a conceptual model.
- Facts relating terms to each other - The nature or operating structure of an organization can be described in terms of the facts that relate terms to each other. To say that a customer can place an order is a business rule. Facts can be documented as natural language sentences or as relationships attributes and generalization structures in a graphical model.
- Constraints (here called 'action assertions') - Every enterprise constrains behavior in some way and this is closely related to constraints on what data may or may not be updated. To prevent a record from being made is in many cases to prevent an action from taking place.
- Derivations - Business rules (including laws of nature) define how knowledge in one form may be transformed into other knowledge possibly in a different form.

Organizations driving to incorporate business rule development and documentation into its data stewardship efforts consider:

- Focus on the major business activities of each subject area to discover the currently relevant and foremost business rules
- Include the examination of business rules that use human judgment as well as system activities so that the rules document actions that are not limited by what an application does ('business' rules)
- Examine current workflows processes and new activities to discover essential business rules that may have been hidden
- Review the process for defining maintaining and enforcing business rules
- Identify other practices within the organization that create business rules (e.g. mandates policies guidelines etc.)
- Identify a process for retiring ineffective or outdated business rules and the documentation of this change
- Develop basic business rules during any data definition effort recording the rules and the associated meta data building from known and established rules to articulating new (or undefined) business rules.

Guidelines for effective business rules management. Business rules should:

- Be written and made explicit.
- Be expressed in plain language.
- Exist independent of procedures and workflows (e.g. multiple models).
- Build on facts, and facts should build on concepts as represented by terms (e.g. glossaries).

- Guide or influence behavior in desired ways.
- Be motivated by identifiable and important business factors.
- Be accessible to authorized parties (e.g. collective ownership).
- Be single sourced.
- Be specified directly by those people who have relevant knowledge (e.g. active stakeholder participation).
- Be managed.

Note: Business Rules Management Systems (BRMS) support the automation of the Business Rules Management practice.

Processes	
-----------	--

sE1	Manage Supply Chain Business Rules
-----	------------------------------------

sE1.1	Gather Business Rule Requirements
-------	-----------------------------------

Supply Chain Optimization is a part of the enterprise strategic plan for leading edge companies. SCO allows top management to redesign the supply chain as part of the enterprise's overall strategy, in response to actual or anticipated changes in the marketplace. Based on actual data or analyst projections (example: Oil will each \$120.00 a barrel) companies run multiple computer simulations, looking for an optimal solution for:

- Vendor locations
- Inventory levels
- Global transportation costs
- Product lifecycle manage (NPI through EOL)
- Distribution hub locations
- Environmental (carbon footprint)

Improvements are planned in a proactive rather than reactive manner, providing financial and velocity advantage over competitors.

The optimized supply chain can provide a reduction in the cash to cash cycle, shorter customer lead times, lower inventory requirements, lower E&O inventories, and lower transportation costs. Technology providers offer individual applications and/or the complete set of optimization software packages in both IT Enterprise and SaaS solutions.

Self-Service Warranty Claim Submittal enables customers and service providers to submit warranty claims over the web, reducing internal validation and processing workload. This can be accomplished as a batch load of several claims at the same time or individual claims submitted one at a time. Information captured at time of submittal helps with further analysis and disposition. Results of the analysis can be made available online based on login access levels, so that the same information can be submitted to appropriate authorities as needed. Furthermore, auto approval and payment of certain claims can be considered if they satisfy certain criteria.

Business rule review is performed by supply chain middle and upper level management of an organization. In this process manager ensures that the framework for analysis of the business rule is in line with the objectives and strategy of the organization. The rule itself needs to be aligned with the operational aspects it will govern. The rule should be clearly defined and linked to the respective business process or processes.

Proper predictive models are the key to being able to proactively manage developing problems rather than reactively coping with the missed milestones. Lean planning creates real world project plans which robustly model the project from initiation to final delivery.

Beginning with the end deliverable is the best way to create a tactical plan. Lean planning identifies information flow between tasks and pushes back this information one task at a time during the planning process creates a robust project model that identifies ALL the work that must be completed to accomplish the end deliverable of the project.

Lean planning uses five focusing questions:

- What is this deliverable?
- Who makes this happen?
- What's the last significant thing that he/she does?
- What tangible inputs does he/she need?
- Are these enough?

The result is that each task has:

- The resource responsible for the task
- All of the required inputs identified
- The expected time to complete the task (50% confidence level)
- The guaranteed to complete estimate (95% confidence level)
- The quantifiable output that clearly signals the end of the task.

sP1.3	Balance Supply Chain Resources with SC Requirements
Metrics	
RL.3.37	Forecast Accuracy

The practice of refurbishing materials during the receiving processes (i.e. Source processes) for returned materials.

This practice enables shorter processing cycle times through the refurbishment of materials that have been deemed eligible for rework and return. Specifically, when defective materials are returned and processed by the receiving function, repairs, modifications, or enhancements are made by the same receiving personnel (versus resources associated with the Make process elements) and sent to the shipping function for return to the original recipient. This practice would only be used for a subset of refurbishment processes (e.g. high volume repair returns, minor modifications required, etc) and would require additional training for and capabilities from receiving personnel. The benefit of this process would be not only shorter overall return processing time, but also reduced capacity requirements from existing assets/processes related to the Make process elements.

HS.0119	Return Management

In order to minimize lost productivity, many companies offer a loaner program for their customers when they need to return a defective product. The loaner can be arranged at the time of Return Material Authorization process, so that the customer receives the loaner before actually returning the defective product. When the customer receives the repaired product, loaner would be sent back. Tracking and reserving/scheduling of loaners is an important part of a loaner program.

Mobile access to information in supply chain means information on status metrics supply and demand are available in the internet smart phones and other similar mobile devices. This requires integration of heterogeneous hardware and software components that forms the supply chain.

The hardware includes Smartphones RF devices RFID devices Bar codes I-Pads laptops and other mobile and handheld devices. The software includes ERP (Enter[prise Resource Planning) software various database and middleware network programs and protocols. Java OOPS (Object oriented programming) and enterprise services forms its core components.

Bar coding is the practice of adding machine readable labels to packaging of goods, in order to increase reading speed and reducing reading errors. Bar coding requires a standard for bar coding, a barcode printer and a barcode reader. A barcode reader (or barcode scanner) is an electronic device for reading printed barcodes. Like a flatbed scanner it consists of a light source a lens and a light sensor translating optical impulses into electrical ones. The barcode scheme defines the technical details of a particular type of barcode: the width of the bars character set method of encoding checksum specifications etc.

Standards: There are many types of bar codes however most used ones are UCC/EAN128. This is the most commonly used standard in Retail and other industries. The new development in this area is RFID tags. In any of these forms it stores information about the product and passes it to any automated computerized software for further processing.

Spend analysis involved collection of data across procures to pay process in an enterprise and slicing and dicing these data into useful information. It is used for supplier negotiation future saving forecasting working capital and cash management activities. The various software available in the industry include: SAAS, ARIBA, SAP-SRM, Oracle-Supply chain. Enterprise Level Spend Analysis aims at enhancing visibility of the spends in an organization and provides high value input for operational and strategic decisions.

The Long Term Supplier Agreement/Partnership is a communication framework of buyer and supplier relationship. It varies in two continuum from very informal to highly formal such as bound by strict legal contracts. The other one is from a simple supplier of commodity to a partner in the value chain. In a very basic level most of the long term agreements replaces the conventional multiple purchase orders. In the most complex ones involves long term strategic partnership with sharing of know-how and involvement in early product development.

It aims at total quality management across the value chain.

Backflush is a concept where issuing of the material automatically happens once the finished product is ready. For example assume 2 units of Raw Material 'R' is required to make a single Finished Product 'P'. As soon as 1 unit of 'P' is produced the inventory system reduces 2 units of 'R'. This concept is very well known in the industry as Backflush. The drawback of this system is that there is no real-time visibility of Raw material 'R' in the whole process. The accuracy of the inventory is also dependent on theoretical assumption that 2 'R's are required to make 1 'P'.

However many industries do not have the luxury of having accurate theoretical inventory quantity. Mixed Mode Practice (or Reverse Issue Method) is be used in the production lines where the input quantity varies based on several process parameters. A system can be enabled where as soon as the first step of the manufacturing process is started the theoretical raw material quantity is issued against the job. In the example above as soon as the 1st step to manufacture product 'P' starts in the inventory system 2 units of R are issued. Once the final step of the manufacturing process is completed the reverse issue method comes into picture. Based on the process conditions experienced lets say 1.8 units of Raw Material 'R' are used up to make 1 quantity of 'P' then the operator enters the Reverse issue quantity in the system as '-0.2' (1.8 - 2). This is entered at the time of entering the finished quantities produced at the end of the manufacturing process step. However lets say during manufacturing 2.2 units of Raw Material 'R' is used up to make 1 quantity of 'P' then the operator enters the reverse issue quantity in the system as '+0.2' (2.2 - 2). The advantage in this system is that there is an accurate quantity of raw material in the inventory system at any point of time.

Effective scheduling should not only include production related attributes (e.g. rated/demonstrated capacity asset loading sequencing changeover constraints etc.) but also other directly and indirectly related processes. Due to the complexity and data intensity of this practice this particular process is typically managed by a separate (and possibly dedicated) module within an ERP system. The objective of production scheduling optimization is to maximize the throughput on a given asset while optimizing (increasing or decreasing depending upon the characteristic) the other related processes. Examples of other activities that should be considered when optimizing a production schedule are as follows:

- Preventative maintenance program schedule and requirements - This information is typically stored and managed in a separate maintenance management system or EPR module. A linkage between the requirements of the maintenance program and the scheduling system is critical to achieve overall optimization.
- Shared resource considerations - While production routings should provide the majority of requirements for a given production run availability and compatibility of other resources/assets (either co-located or remote) should be available to the scheduling tool. Shared resource information would generally be available in an ERP's advanced planning module (e.g. network planner etc.) or in the resource management data tables/modules.
- MRP and DRP requirements - While some scheduling systems might include material and distribution planning requirements and optimized production schedule must have access to data regarding in-bound material availabilities as well as out-bound distribution schedules. If MRP/DRP processes are managed separately from production scheduling then these processes/systems must be integrated to not only to seamlessly communication requirements but also to ensure that the overall production schedule is optimized.
- Product quality management considerations - Similar to other processes noted above management of product quality can also be managed in a separate process/system. An effective scheduling system must have real-time access to any product quality constraints (e.g. products or families on hold etc.) This will ensure that production capacity is not allocated to defective designs etc.

Best Practices

Best practices are 'current', 'structured' and 'repeatable' practices that have had a proven and positive impact on supply chain performance:

- Current: Not emerging, not outmoded.
- Structured: Feature a clearly stated goal, scope, process, and procedure.
- Proven: Demonstrated in a working environment, and linked to key metrics.
- Repeatable: Proven in multiple organizations and industries.

SCOR best practices have been chosen by SCOR practitioners in diverse industries. It is understood that not all best practices will yield the same results for all industries or supply chains.

Investment, Risk: Moderate, Results: Moderate.

Supply chain risk management is the systematic identification, assessment and mitigation of potential disruptions in logistics networks with the objective to reduce their negative impact on the logistics network's performance.

A high number of potential disruptions can negatively impact supply chain performance. Potential disruptions can either occur within the supply chain (e.g. insufficient quality, unreliable suppliers, machine break-down, uncertain demand, etc.) and outside (e.g. flooding, terrorism, labor strikes, natural disasters, etc.). Both are considered in an integral three-phase approach for supply chain risk management:

- **Risk Identification:** What can go wrong? What is uncertain? Based on a description of a supply chain with SCOR, each single process should be looked at with regards to potential disruptions that may negatively harm the performance and which countermeasures are already in place. Result of this phase is a list of the relevant supply chain risks.
- **Risk Assessment:** How likely is it that a certain potential incident will occur? What is the impact? The likelihood of occurrence and the negative impact on SCOR performance measures of each supply chain risk should be qualitatively or quantitatively evaluated. Result of this phase is a list of serious risks that can be visualized in a risk portfolio with the dimension probability of occurrence and negative impact.
- **Risk Mitigation:** How can the risks be controlled and monitored? Mitigation measures (e.g. improved planning methods, alternative suppliers, response plans, redundant infrastructure, etc.) should be evaluated for the serious risks. After having checked the cost-efficiency of the alternative measures, the appropriate measures should be chosen and implemented. A risk can be mitigated by decreasing the likelihood that it will occur or by decreasing its impact if it does occur. Alternatives to mitigation include acceptance, transfer, and risk sharing.

Best Practice Need and Suitability Indicators:

Supply chain risk management is suitable especially for supply chains in uncertain environments, with low redundancies in terms of material and capacity buffers as well as high requirements on the supply chain performance. Risk management is particularly applicable to organizations that have a low tolerance for risk in their business strategy.

Additional Comments

Examples for typical supply chain risks are raw material shortage, supplier failures, increased material price, machine break-down, uncertain demand, inaccurate forecasts, change orders and transportation failure. Other risks not directly related to the supply chain are for example product liability risk or strategy risk. Therefore supply chain risks are only a part of all business risks. Hence, supply chain risk management should be integrated in an enterprise risk management.

For the implementation of supply chain risk management in organizations the process and responsibilities have to be clearly defined. The resources, e.g. staff, budget, should be assigned by the top management. The participating staff members need to be motivated and skilled.

Impact on Supply Chain Performance Attributes/Metrics

Attribute	Experienced Impact
Reliability	The over-all objective of SCRM is to increase the reliability of the supply chain and decrease the variability of the order fulfillment.
Responsiveness	The variability of the order fulfillment cycle time is reduced and the recovery time from disruptions is shortened.
Flexibility	Due to the proactive proceeding the supply chain is better prepared for sudden changes and thus more flexible.
Cost	The logistics costs are reduced in the long run.
Asset Management	The variability of inventories in the supply chain is reduced.

Key Best Practice Success Factors

Technology - Features modeling and simulation tools are frequently employed to identify and assess risks as well as mitigation approaches. Advanced planning tools can be employed to rapidly reconfigure the supply chain in response to a disruption. Moreover, software for well-established assessment techniques, e.g. FMEA, FTA, ETA, exists.

Other Success Factors - The risk management process should be carried out cross functional and - if possible - together with representatives from all companies of the supply chain.

Risk management strategies are developed and communicated. Commonly used strategies are Risk Mitigation, Risk Avoidance, Risk Transfer and also Risk Acceptance.

- Risk Mitigation is a plan to reduce the probability of occurrence or minimize the impact of the risk.
- Risk Avoidance occurs when the supply chain risks are too high in terms of its probability of occurrence and impact and beyond the threshold limits of the organization's appetite for risk.
- Risk Transfer occurs when part or all the risk can be transferred to another process where it presents a better prospect of management or mitigation through less costly actions.
- Risk Acceptance occurs when a risk has low probability of occurrence and low impact and for which a contingency plan is easily available for deployment if the risk occurs.

Risk management strategies may differ by supply chain.

The practice of reducing the time it takes to change a production line, equipment or machine from running one product to the next. The ability to rapidly change between products is increasingly important in the situation where lot sizes are reducing. In general there are three focus areas to reduce changeover time:

- Eliminate. Eliminate non-essential activities. This includes replacing only essential parts and developing universal parts where possible.
- Prepare. Prepare and setup external to the equipment. Prepare the die (such as heating, flushing, calibration and alignment) prior to the changeover.
- Simplify. Simplify setup internal to the equipment. This includes the use of single- or limited-touch fasteners, auto- or self-alignment pins.

Similar to: Single-touch exchange of die.

Note: The single-minute reference is to the speed of exchange not the actual number of minutes it takes to make the change for each and all applications.

Network prioritization for risk identification is the process of prioritizing parts of a supply chain for risk analysis based on the overall risk potential in each portion of the supply chain. Prioritization is typically based on the criticality of the component or product flowing through a portion of the supply chain to your business and the number of sources for the material flowing through that portion of the supply chain.

The practice where a customer generates the invoices for the products or services it consumed from a supplier. The advantage of this process for the company that self-invoices is that reconciliation processes - such as 3-way verification prior to payment of invoices - are no longer required. (The reconciliation processes are transferred to the supplier.) A common application of this process is self-invoicing for transportation services and materials consumed from supplier-owned/consignment inventory. Conditions for self-invoicing:

- Clear service level agreements in place between supplier and customer of the product or service.
- Clear ways to measure the level and quality at which the services were delivered or materials were consumed.
- Defined and agreed processes for record-keeping, reporting and claims.
- Standards for electronic data communication between supplier and customer (EDI)

Consignment inventory is not a pre-requisite for self-invoicing. Materials ordered (call-offs) from a master contract may also qualify for self-invoicing.

To avoid overstock situations, we regularly review Baseline inventory levels. Baseline inventory is defined as the lowest stock level that a particular SKU actually had during the last 12 months. It means that there will be a baseline inventory for all those items that did not have a stock-out. At maximum, the baseline inventory should match the safety stock. If it is significantly higher than the safety stock (the safety stock is never effectively utilized), the planning parameters and buffers in the system need to be reviewed. To evaluate a whole product range, we calculate the total aggregate value of baseline inventory. The metric is expressed as total value, number of items affected, and as % of overall stock value.

This practice will be most effective in a more stable environment with established products. In a highly dynamic market environment, an important outcome of S&OP will be the setting of strategic buffer stocks for key items. To check whether they are on a reasonable level, baseline evaluation can be used.

The practice where materials are ordered, shipped, received and/or staged in the same sequence as they will be consumed. The materials generally are configurable or have many variants (an example variant: shades of color). This practice can be applied in on-site processes and in supplier-to-manufacturer processes.

- On-site processes: The materials are picked from an inventory location (such as raw material warehouse) in the exact sequence of the production schedule/line and delivered to the point-of-use (pick-to-sequence). The operator is required to use the materials in the sequence they were provided. This can apply to materials sourced using S1, S2 and S3 processes.
- Supplier-to-manufacturer processes: The materials are ordered from the supplier in sequence (order-in-sequence). The supplier processes the order and loads the transportation vehicle in sequence (ship-to-sequence). The materials are then unloaded and delivered to the point-of-use (receive-to-sequence). This version applies to S2 and S3 sourcing only.

It is important that order managers, material handlers and operators understand that the materials should remain in-sequence at all times. Accidental resequencing may cause erroneous products, dangerous working conditions and rework. Example physical implementations include conveyor systems but also the use of trays or bins that allow the materials to be kept in sequence during transportation and handling.

Alternative names: Just-In-Sequence, In-Line Vehicle Sequencing (ILVS)

Notes: This is not FIFO. FIFO addresses using/delivering the oldest materials first. Production Line Sequencing eliminates the cost, time and inventory needed for searching and sorting through materials.

Pull-based (Demand) replenishment is an approach that utilizes customer demand (‘pull’) to replace and optimize inventory while reducing total net landed cost. It has been a widely recognized, effective practice for decades.

With a pull-based approach, the signal to replenish downstream inventory is driven by actual demand or usage, rather than by a forecast that pushes products and materials into the supply chain. Pull-based replenishment uses methodology that uses historical demand variability between forecasted demand vs. real customer demand to identify the appropriate inventory levels.

Supply chains and supply networks both describe the flow and movement of materials & information, by linking organizations together to serve the end-customer. Network Strategy Optimization can be used to determine optimal manufacturing and warehouse locations based on focusing on reducing total supply chain costs (typically biased on reducing transportation costs). This is done by reviewing a supply chain network of product supplying and market facing businesses to consolidate inventory stocking locations.

Use of more sophisticated qualitative and quantitative forecasting processes and tools to improve customer demand forecast typically at SKU level. This would be an improvement to traditional forecasting process; Can be combined with additional opportunities such as, S&OP, which uses forecasting modeling.

Examples of Qualitative forecasting methods:

- Informed opinion and judgment
- Delphi method
- Market research
- Historical life-cycle Analogy.

Example of Quantitative forecasting methods:

- Last period demand
- Arithmetic Average
- Simple Moving Average (N-Period)
- Weighted Moving Average (N-period)
- Simple Exponential Smoothing
- Multiplicative Seasonal Index

Collaborative inventory planning can be used as a way to extend supply chain planning with key customers. It can be done through a joint (Sales & Operations Planning)

S&OP meeting between each key customer and supplier to discuss how to manage demand and supply across the extended enterprise (key customers). S&OP will entail review of historical and future customer demand, demand forecast accuracy, planned outages by customer or supplier, long-term planning, etc. Collaborative forecasting, the supply chain members jointly maintain and update a single forecasting process in the system. Hence, forecasting information becomes centralized

AM.2.4	Supply Chain Revenue
AM.2.8	Inventory

Consignment inventory is a family of business models in which the buyer of a product provides certain information to a supplier of that product and the supplier takes full responsibility for maintaining an agreed of the material, usually at the buyer's consumption location (usually a store). Consignment Inventory can be combined with additional opportunities such as extend inventory planning across Key Suppliers by using collaboration. Intent is to have suppliers carry raw material inventory on their balance sheet until consumption.

Processes	
sP1	Plan Supply Chain

Metrics

AM.2.4	Supply Chain Revenue
AM.2.8	Inventory

The practice of shipping products and goods directly from the manufacturing plant to the customer (bypassing consolidation activities in warehouses and/or distribution centers). In Retail, Direct Shipment (also called Drop Shipment) is a supply chain management technique in which the retailer does not keep goods in stock, but instead transfers customer orders and shipment details to either the manufacturer or a wholesaler, who then ships the goods directly to the customer.

Using direct ship will bypass a distribution network and may reduce distribution finished goods inventory based on Customer Locations. Direct ship can be combined with additional opportunities such as Inventory Management by using Supply Chain Network Optimization.

AM.2.4	Supply Chain Revenue
AM.2.8	Inventory
AM.3.9	Capacity Utilization

Use Lean principles to reduce size of manufacturing batch sizes to better match customer demand vs. asset utilization/quality issues. Historically, manufacturing companies have operated with large batch sizes in order to maximize machine utilization, assuming that changeover times were `fixed` and could not be reduced. Because Lean calls for the production of parts to customer demand, the ideal batch size is ONE. However, a batch size of one is not always practical, so the goal is to practice continuous improvement to reduce the batch size as low as possible. Reducing batch sizes reduces the amount of work-in-process inventory (WIP). Not only does this reduce inventory-carrying costs, but also production lead-time or cycle time is approximately directly proportional to the amount of WIP. Therefore, smaller batch sizes shorten the overall production cycle, enabling companies to deliver more quickly and to invoice sooner (for improved cash flow). Shorter production cycles increases inventory turns and allows the company to operate profitably at lower margins, which enables price reductions, which increases sales and market share.

Batch size reduction can be combined with additional opportunities such as, Right size frequency of production wheel or Reorder Point Production Models (Pull-Based Replenishment).

AM.2.4	Supply Chain Revenue
AM.2.8	Inventory
AM.3.9	Capacity Utilization

The practice of formal freight carrier performance reviews to reduce the risk of landed cost budget variances. A formal freight carrier performance evaluation is crucial as transportation partners represent the interface between supplier and customer. The quality of delivery on time and in good condition has enormous impact on customer satisfaction, return rates and repeat sales

A carrier evaluation program needs a comprehensive list of evaluation metrics to reflect overall service performance and cost improvement objectives. Evaluation criteria should include quantitative as well as qualitative measures. Quantitative criteria may include on-time delivery performance, claims ratios, billing accuracy, cost performance and other measurable criteria. Qualitative measures may include driver and sales representative responsiveness, the quality of customer service, stakeholder surveys, customer complaints or other value-based assessments

In addition, a freight carrier's delivery performance and impact related to supply lead-time variability (due to early and late deliveries) should be evaluated. If a product is shipped to a customer and it arrives late: then limited/no inventory available. Conversely, if a supplier ships raw material to a company and the shipment is received prior to the need date - then excess inventory is carried. This would require a work process that investigates reasons and how to manage such situations (i.e. situation attributable to supplier purposely shipping product early to move inventory quickly; receiving company may delay shipment receipt until inventory is needed; adjust the transit lead time to safeguard against this type of situations which is causing additional inventory due to carrier delivery performance)

AM.2.4	Supply Chain Revenue
AM.2.8	Inventory

Effective inventory management is the result of outstanding inventory control and inventory management. Inventory control is managing the inventory that is already in your warehouse, stockroom, or store and inventory management is determining when to order products, how much to order, and the most effective source of supply for each item in each warehouse.

Incentives can be used to drive successful and effective inventory management. The incentive program should include annual goals and targets that integrate inventory metrics into goals for key roles with decision making responsibilities in the business. Balance is the key to insure that inventory levels are not driven to the point of adversely affecting overall profit. Using incentives to drive specific short-term inventory targets should lead to improved inventory levels.

Processes	
sP1	Plan Supply Chain
Metrics	
AM.1.3	Return on Working Capital
AM.2.4	Supply Chain Revenue
AM.2.8	Inventory

Attaining acceptable delivery performance is the most significant manufacturing challenge faced by many organizations. Not meeting quoted order lead times is extremely disruptive to how the supply chain is planned and how inventory is managed. To minimize the disruption, firms should analyze by business known violations of customer order lead time rules during customer order placement to determine how pervasive this is by business. The business should then develop a corrective action (training, better understanding of cause and effect, approvals, etc.) plan for prevention of occurrences to help more effectively manage inventory.

Processes	
sP1	Plan Supply Chain

Metrics	
AM.1.3	Return on Working Capital
AM.2.4	Supply Chain Revenue
AM.2.8	Inventory

Unsold inventory is not `money in the bank`. A company should identify idle assets by analyzing production records, reviewing stock status reports to isolate inventory that is slow moving or out of balance, and sell/reduce the nonstrategic inventory. This would include selling of obsolete and excess inventory by establishing and offering short term discounts to turn inventory to cash.

Processes	
sP1	Plan Supply Chain

Metrics	
AM.1.3	Return on Working Capital
AM.2.4	Supply Chain Revenue
AM.2.8	Inventory

Re-validate existing Master Data (order lead times, replenishment times, transit times, etc.) to ensure it matches current operational capabilities and performance. This information is used in inventory reorder point and target setting to determine inventory replenishment size/frequency. This is a critical step in inventory management and requires the monthly discipline to keep up on this due to the number of processes/systems that rely on this information as key input variables; Establish clear role/responsibility/accountability for Master Data Management; Critical prerequisite for a wide range of inventory opportunities; Can be combined with additional opportunities such as, Pull-based Replenishment

Processes	
sP1	Plan Supply Chain

Metrics	
RL.2.3	Documentation Accuracy
AM.1.3	Return on Working Capital
AM.2.4	Supply Chain Revenue
AM.2.8	Inventory

Assess potential to change sourcing decisions to local source point (likely the optimal source point) to reduce overall replenishment lead time. This would reduce both transportation and inventory costs. This could impact service level and revenue objectives depending on balance demand and supply decisions. Consider using advanced planning system to Optimize sourcing decisions. Can be combined with additional opportunities such as, Supply Chain Network Optimization

Notes: Buying less expensive materials from a remote supplier with associated higher inventory levels might be more economical than sourcing more expensive per unit materials from a nearby supplier with associated reduced inventory levels. Hence overall effect should be considered.

Processes	
sP1	Plan Supply Chain

Metrics

This practice of requiring and enforcing a return shipment is accompanied by a company-issued Return Material (or Merchandise) Authorization (or Agreement) (RMA). Information and data associated with an RMA, when available at the point of receipt, will allow for expedited receipt and verification processes. Typical RMA detail includes SKU number(s), description(s), quantities, return condition, reason for return, and requested next action. Prior to the physical receipt of the inbound materials, the receiving function would obtain a summary of all anticipated returns. This summary report would serve as the basis for validation (items, quantities, etc.) as well as provide direction regarding storage locations and possibly disposition (return to stock, rework, resell as used, destroy, etc.) after completion of the receipt. Storage/staging locations could vary depending upon the next required action for the return materials.

Metric alignment refers to the organized and deliberate development of metrics across an organization. The process starts with organizational/business or supply chain metrics then decomposes to organizational processes at level-2, level-3, and further if desired.

Following are key traits that define good metrics:

- Align to supply chain and business strategy
- Have a clear line-of-sight to the customer or business objective
- Provide a balanced view of performance
- Unflinching measure of the truth – data driven
- Are actionable
- Answer the questions
 - Where are we now?
 - Where do we need to be?

Aligning metrics can be accomplished by following these steps:

- Define supply chains utilizing the SCOR methodology. This typically involves creating a matrix of product family versus customer group (example)

Supply Chain Definition Matrix					
	Geography, Market and/or Customer				
	Retail	Distributors	Direct	OEM	Government
Food products	X	X	X		X
Technology Products	X			X	
Durable Products			X		

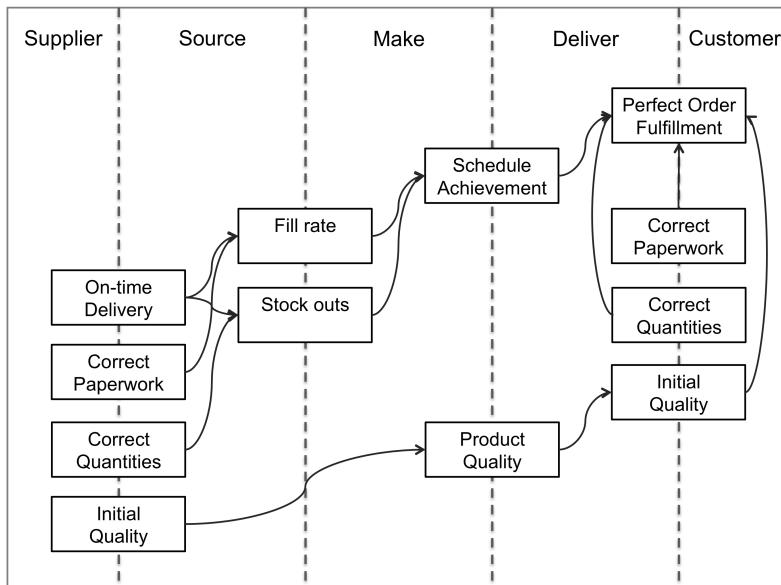

- Prioritize supply chain performance attributes as defined in the SCOR model. These are Reliability, Responsiveness, Agility, Cost, and Asset Management Efficiency (Assets). This step requires us to clearly document performance priorities by supply chain based on competitive pressure and customer requirements.

Competitive Requirements					
	Retail	Distributors	Direct	OEM	Government
Reliability	Superior	Parity	Parity	Parity	Parity
Responsiveness	Parity	Parity	Superior	Superior	Parity
Agility	Advantage	Advantage	Advantage	Advantage	Advantage
Cost	Advantage	Superior	Advantage	Advantage	Superior
Assets	Parity	Advantage	Parity	Parity	Advantage

- The next step is to define key metrics for each supply chain. Utilizing the 5 performance attributes as the framework we select appropriate SCOR level-1 supply chain metrics.

Performance Attribute	Strategic Metric	Current Performance
Reliability	Perfect Order Fulfillment	79%
Responsiveness	Order Fulfillment Cycle Time	9 days
Agility	Upside Flexibility	110 days
Cost	Total Cost to Serve	89%
Assets	Cash-to-Cash Cycle Time	164 days

- Once metrics are defined at the supply chain level (level-1), then operational metrics should be selected or derived from this baseline. (See diagram below)

Processes

sE2 Manage Performance

BP.075RMA is also known as "Goods Return Authorization (GRA)" in some countries.'

RMA establishes procedures and policy to clearly identify under which circumstances a return from a customer will be accepted, and outline the steps to follow in order to process the return.

It is common or standard practice to establish RMA procedures and policy involving paperwork to be submitted by the Customer using mail, fax or e-mail (and processed?)

Best practice is to enable customers to fill out RMA forms over the web, and submit requests to be reviewed/processed electronically, cutting down the manual effort, processing time, and risk of error, resulting in lower processing cost and better customer service.

When an RMA is approved, customer ships the product to the designated location in the specified manner. Shipment recorded by the customer, acts as the advanced shipping notice for the receiving department, which is informed about the scheduled delivery.

Processes	
sDR1.1	Authorize Defective Product Return
sDR1.2	Schedule Defective Return Receipt

Metrics	
RL.3.55	Warranty and Returns

Bar Coding allows faster and more accurate processing of returned materials. Receiving department can easily identify the materials returned from customer and move them through the transfer process.

ISO and IEC are the two organizations heavily involved in development of worldwide standards related with usage of bar codes. The mapping between regular text or data and barcodes is called a symbology. Initially, barcodes were used to represent any kind of written text by varying the width and spacing of parallel lines. This type of barcode symbology is referred to as linear or one-dimensional (1D). Later they evolved into other kinds of geometric patterns in two dimensions (2D). Although 2D systems use a variety of symbols (such as rectangles, dots, hexagons, etc), they are generally referred to as barcodes as well. Barcodes were initially scanned by special optical scanners called barcode readers. Over time, additional types of scanner devices and software became available on devices including desktop printers and smartphones.

Business partners in a reverse logistics supply chain need to agree on type of bar code symbology, size and location on packaging to facilitate use of bar codes in returns processing. This agreement is established as result of collaboration between stakeholders, and technology to support this agreement needs to be acquired and deployed. The implementation includes bar code printers and readers depending on who will generate the barcode labels, and who will actually read the bar codes to perform certain tasks such as receiving, shipping, inventory transfers, etc. Type of information to be included on these labels depends on the process, and again needs to be agreed upon between stakeholders.

Bar coding on the package or returned item that identifies the products, as well as the original sales order number usually gets generated at the time the package is produced or shipped to the customer. However, additional information such as Return Material Authorization number, quantity, and reason for the return could be included on a new label as part of the return process.

Processes	
sDR1.3	Receive Defective Product (includes verify)
sDR1.4	Transfer Defective Product
Metrics	
RL.3.55	Warranty and Returns

More and more companies are providing prepaid return shipping labels and instructions for return at the time the product is sold and shipped to the customer. Common examples include: return if customer is unsatisfied with merchandise, return of the empty container that the new full container has replaced (e.g., printer cartridges), The return freight cost has been pre-negotiated, the original shipping package can be re-used for the return, and once the return label is used further tracking is also available via transportation companies using the tracking number pre-assigned to the label.

Processes	
sDR1.1	Authorize Defective Product Return
sDR1.2	Schedule Defective Return Receipt
sDR1.3	Receive Defective Product (includes verify)

Metrics	
RL.3.55	Warranty and Returns

Customers can track their shipment using the tracking number assigned by the carrier when they are returning a defective product. If the same information is provided to the vendor during Return Material Authorization process, receiving department can better plan for the receipt.

Processes

---------	----------------------

Performance management (PM) includes activities that ensure that goals are consistently being met in an effective and efficient manner. Performance management can focus on the performance of an organization a department employee or even the processes to build a product or service as well as many other areas. 3 things are required to achieve effective performance management:

- The organization, department or employee must have measurements that tell them what their current performance is
- The organization department or employee must also have a performance goal that is where do they need to be
- There must exist the means or methodology to adjust performance

Without basic performance management tools managing a supply chain is difficult or impossible.

Processes

sE2

Manage Performance

Bowtie Risk Management is an approach to managing risk that involves separating management into prevention and recovery actions.

Management starts with prevention by first identifying the trigger events that will lead to the risk event occurring. Then you can identify ways to either: prevent or detect the trigger event or disrupt the link between the trigger and the risk event. Management then moves to recovery where you identify and improve the process to recover operations after the risk event occurs.

Bowtie Risk Management is best suited for managing complex risk events or events that can have a significant impact on the supply chain. It provides a structure around preventing and recovering from risk events. Bowtie Risk Management requires structured management of the risk management process. The process should be executed with people familiar with the supply chain operations in a disciplined setting.

Impact on Supply Chain Performance Attributes/Metrics

Attribute	Experienced Impact
Reliability	The Bowtie approach results in better defined risk management programs which will increase the reliability of operations.
Responsiveness	None
Flexibility	The Bowtie approach results in better defined risk management programs which will increase the ability of the supply chain to respond to disruptive events.
Cost	The Bowtie approach results in better defined risk management programs which will reduce the cost impacts due to risk events.
Asset Management	The Bowtie approach results in better defined risk management programs which will protect assets from loss due to risk events.

Key Best Practice Success Factors

- Technology Features: None
- Other Success Factors: Applying the bowtie approach requires structured management of the risk management process. The process should be executed with people familiar with the supply chain operations in a disciplined setting.

The continual improvement practice (CIP or CI) also often called a continuous improvement process) is an ongoing effort to improve products, services and/or processes. Delivery (customer valued) processes are constantly evaluated and improved in the light of their efficiency effectiveness and flexibility.

Successful companies recognize that the path to excellence and competitiveness is best achieved when the company culture embraces concepts of continuous improvement and incorporates these into all daily activities.

- Feedback -- The core principle of CIP is the (self) reflection of processes
- Efficiency -- The purpose of CIP is the identification, reduction and elimination of suboptimal processes
- Evolution -- The emphasis of CIP is on incremental continual steps rather than giant leaps

Continuous Improvement efforts seek 'incremental' improvement over time or 'breakthrough' improvement all at once.

Processes	
sE2	Manage Performance

Project management is the discipline of planning, organizing, securing, managing, leading and controlling resources to achieve specific goals. Regardless of the methodology traditional project management usually includes the following phases:

- Initiation
- Planning or development
- Production or execution
- Monitoring and controlling
- Closing

Common project methodologies include:

- PRINCE2 -- PRINCE2 is a structured approach to project management released in 1996 as a generic project management method.
- Critical chain project management -- Critical chain project management (CCPM) is a method of planning and managing project execution designed to deal with uncertainties inherent in managing projects while taking into consideration limited availability of resources (physical human skills as well as management & support capacity) needed to execute projects.
- Event chain methodology -- Event chain methodology is an uncertainty modeling and schedule network analysis technique that is focused on identifying and managing events and event chains that affect project schedules.
- Process-based management -- Also furthering the concept of project control is the incorporation of process-based management. This area has been driven by the use of Maturity models such as the CMMI (capability maturity model integration)
- Agile project management -- Agile project management approaches based on the principles of human interaction management are founded on a process view of human collaboration.
- Lean project management -- Lean project management combines principles from lean manufacturing with agile project management to focus on delivering more value with less waste.

Leading project management standards include:

- Capability Maturity Model from the Software Engineering Institute.
- GAPPs Global Alliance for Project Performance Standards -- an open source standard describing COMPETENCIES for project and program managers.
- A Guide to the Project Management Body of Knowledge from the Project Management Institute (PMI)
- HERMES method, Swiss general project management method, selected for use in Luxembourg and international organizations.
- The ISO standards ISO 9000, a family of standards for quality management systems, and the ISO 10006:2003, for Quality management systems and guidelines for quality management in projects.
- PRINCE2, Projects IN Controlled Environments.
- Association for Project Management Body of Knowledge
- Team Software Process (TSP) from the Software Engineering Institute.
- Total Cost Management Framework, AACE International's Methodology for Integrated Portfolio, Program and Project Management.
- V-Model, an original systems development method.
- The Logical framework approach, which is popular in international development organizations.

- IAPPM, The International Association of Project & Program Management, guide to project auditing and rescuing troubled projects.

This list is not intended to be all-inclusive.

Processes

sE2

Manage Performance

A process to regularly comparing the inventory-on-hand with the inventory recorded and reconciling the differences. The ability to determine root causes of differences in inventory is required for an effective inventory management. This process is can be conducted while the site is in operation (In general there is no need to halt operations to support cycle counting).

The following definitions apply to cycle counting:

ABC Analysis: A process where the value of use (unit cost x consumption quantity) or production (unit cost x production quantity) is used to determine the inventory management practices. Items with the highest transactional value (A items) have tight inventory control with frequent inventory verification. Items with the lowest transactional value (C items) have less stringent inventory control and have less frequent inventory verification.

Hit: A cycle count in which the perpetual inventory record and the physical inventory count is within tolerances set by this procedure (see section 5).

Miss: A cycle count in which the perpetual inventory record and the physical inventory count is not within tolerances set by this procedure (see section 5)

Recorder Inventory or Perpetual inventory quantity: The book quantity (the quantity recorded in the ERP system) of the material at the time of the cycle count.

Physical Inventory or Inventory-On-Hand: A process to compare the perpetual inventory quantity with the physical inventory quantity of all materials at one time and reconciling the differences. This process usually requires the operation to be shutdown for the duration of the inventory process.

Overview of Process Steps:

- Conduct ABC analysis for all raw materials, semi-finished, and Finished goods based on the following criteria:

Category	% of Transactional Value	Typical % of materials
A	Top 80%	20%
B	Next 15%	30%
C	Bottom 5%	50%

Note: This ABC analysis should be conducted annually or more frequently if the nature of the operation changes significantly between annual reviews.

- Make adjustments to the ABC analysis if business requirements require tighter inventory control than is determined by the ABC analysis. Only upward adjustments from C to B or B to A should be made.
- Assign personnel who will be responsible for the cycle counting process at site/unit. There must be clear delineation of authority between those who conduct the inventory count, identify differences, and determine root causes and those who adjust the financial records.
- Start cycle counting process. Cycle counting should be done on a regular basis, preferably daily. Sites should strongly consider conducting a full physical inventory prior to initiating a cycle counting process.
- For those cycle counts that result in a “miss” or the value of the difference is >\$10,000, financially reconcile differences between perpetual inventory record and physical inventory. If the cycle count results in a “hit” and the value of the difference is <\$10,000, there is no need to financially reconcile the differences.

- If differences result in a “miss” for inventory record accuracy purposes, conduct root cause analysis in addition to reconciling inventory records. Document the root cause analysis and any corrective actions that result from the analysis in the site’s corrective action systems. Document that corrective action was completed. Minimum requirements for corrective action documentation include the corrective action to be taken, the person(s) responsible for the corrective action, an expected completion date, a description of the action taken, and an actual completion date.
- Calculate Inventory Record Accuracy (IRA) metrics monthly and on a 12-month moving average basis. For those sites where a physical inventory has been completed within the past year, calculate the average including only the months since the physical inventory.
- Report IRA and inventory adjustments made as a result of cycle counting through line leadership.

Processes

sE2	Manage Performance
-----	--------------------

The practice of safety stock planning defines for every product at every location (strictly speaking), Safety Stock is established for items that have Independent Demand. Dependent Demand (such as parts or materials that are used in producing a Finished Good that has Independent Demand) would not have safety stock. a minimum inventory level in order to protect from stock-outs. The inventory level can be expressed in quantity of SKUs (static value) or days of supply (dynamic value). The dynamic value is calculated using anticipated demand figures.

Safety stock planning has two purposes:

- Shield from delays or quality issues on the supply side, which could not be forecast accurately, or anticipated early enough
- Cover unexpected demand

Safety stock planning balances the cost of stock-outs (in lost sales or expediting costs) with carrying costs for the safety stock (see above) for a desired service level. Safety stock levels need to be reviewed if patterns in demand or supply change or inventory carrying costs change. Safety stock planning is most often applied to sourced material and other products with low volatility in demand. Safety stock planning typically does not apply to make-to-order or engineer-to-order products, where Safety Stock Planning would be applied at the to the component level. Single-level safety stock planning calculates safety stock for every product and location independently. Multi-level safety stock planning considers interdependencies between location products along the supply chain:

- Bill-of-Material: Decide whether to keep inventory of a product or its components. Shift inventory at component level, if few components can be assembled to many products at short notice.
- Distribution: Shift inventory from distribution centers to the producing plant if there are many distribution centers with volatile demand whereas the total demand is less volatile, if distribution centers can be delivered at short notice.

Multi-level safety stock planning minimizes the total inventory for a given service level.

Supply Network Planning is the integrated planning of all products of a supply chain over all relevant locations. Supply Network planning attempts to fulfill all demand considering all relevant constraints. For fulfillment, Supply Network Planning assigns available inventory, propagates demand to sourcing locations, finds substitute products, or explodes Bills-of-Materials. Using MRP-logic, Supply Network planning creates corresponding orders for supply such as purchase requests, purchases, transportation orders, or production orders.

Supply Network Planning can consider constraints such as available location inventory, inventory reservations, preferred vendors, preferred production sites, minimum inventory levels, preferred routings, bills-of-materials, and durations for sourcing, production, material handling, and transportation between locations.

In case of shortages, Supply Network planning can consider priorities between different types of demand such as more or less important orders from customers, demand from forecast, or replenishment orders, which maintain minimum inventory levels.

Supply Network Planning is a midterm planning practice. Typical planning horizons cover several weeks or months.

Aggregations:

- Demand, supply, and capacities are often aggregated into time buckets such as days, weeks, or months. Alternatively demand and supply can be represented as individual orders.
- Demand and supply for products can be aggregated into demand for product groups.

Machine capacities can be aggregated into machine groups.

Solution methods:

- Multi-plant MRP: This approach executes MRP runs for every location. Dependencies between locations are resolved by heuristic methods, E.g., pre-defining a specific sequence or by executing more than one MRP run per location. Capacity constraints such as production capacity are either ignored or resolved in a second step.
- Linear and non-linear optimization: Demand, supply, and all constraints are translated into a linear or non-linear optimization problem, which can be solved using appropriate algorithms. These algorithms typically require a definition of time buckets, where demand, supply, and constraints are aggregated.
- Capable-to-match: In contrast to bucket-oriented optimization, capable-to-match prioritizes individual elements of supply and demand and matches them in order of priority. It allows to plan orders individually along the entire supply chain.

The ABC inventory classification system groups inventory by their turnover. 'A' items are the top 80% of the total annual usage dollars, 'B' items make up the next 15% of total annual usage, and 'C' items are the remaining items are the remaining 5%. This analysis serves as a base for directing a planners attention and decision making. E.g., A-parts are planned more carefully or a company expects more rebates from their suppliers for A-parts.

ABC inventory classification simplifies rules for planning and procurement operations as corresponding rules are defined not for individual materials but for all A-parts, B-parts, and C-parts.

An extension to the ABC classification is the ABX-xyz classification, which in addition groups inventory items by their demand pattern:

- x: Regular demand, low volatility
- y: Seasonal demand, high volatility
- z: irregular demand

The result is a 3-by-3 matrix with a total of 9 classes, which allows to define business rules for planning and procurement more individually.

The practice of 360 Degree Closure entails ensuring that all aspects of the Production Process have been completed before hand over to the next stage in the Supply Chain.

- Confirmation of actual activity consumed in production process (machine time, labor time, energy, quality processing)
- Check material usage (Goods issues, back flushing, miscellaneous usage)
- Check all Goods Receipts from Production and confirm the final Goods Receipt
- Check that the order cost balance/ variance (Credit from Production vs all Debits) is acceptable
- Ensure that no further goods movements to the Order will be allowed
- Ensure acceptance from/ handover to the relevant receiver (warehouse/ FG Stores/ Quality Control)
- Flag the Order as complete from a Production point of view.

Notes: Tight MAKE Order housekeeping ensures that upstream sourcing and downstream delivery has a true picture of component requirements and finished goods availability respectively

The practice of 'Perfect Pick' Putaway entails ensuring that when finished goods are in a position to be picked for a Sales Order Delivery they are in the correct quantity in the correct physical location and in the correct condition for a 'perfect pick'.

- Check that the product is received in the correct quantity and in a Saleable Condition from Production
- If necessary check that the relevant Quality Management steps have been completed e.g. Results have been recorded/a usage decision has been made.
- Ensure that the relevant supporting documentation is available e.g. Certificate of Analysis.
- Check that the Product has been stored in the correct quantity and in correct Storage Location or Warehouse Bin and that all relevant Warehouse postings have been confirmed.

Notes: Ensuring that the put away of Finished Goods stock is such that the right quality and quantity is in the right place means that the downstream pick process for the Customer Delivery is optimal.

The practice of reviewing and maintaining MRP proposals by days of supply entails understanding demand and the corresponding MAKE proposals and then monitoring the exceptions:

- Evaluate Planned Orders for Production as per output from MRP with reference to oldest demand
- By exception validate MRP proposals matching demand and that business rules are satisfied
- Reschedule where possible
- Adjust proposal quantities and dates according to business intelligence e.g. S&OP input

Comments: Management by exception when understanding production proposals for a select number of SKUs in a vast Production Range is key to an efficient planning process

The practice of evaluating Work Centre loading entails identifying bottlenecks in operations and then evaluating the planned loads on these work centers:

- Evaluate work center loading over the optimal horizon(s)
- Evaluate pooled capacities and/or work center hierarchies.
- Record relevant information for input to balancing processes.
- Ensure all shift patterns efficiencies, breakdowns, maintenance shutdowns etc. are reflected in the available Production resources

The practice of balancing and firming up production activities and available resources entails best satisfying demand given the various resource, material and other restraints:

- Schedule (manual or automatic) MRP Proposals (date and quantity) to optimize the given work center loads within the agreed firm horizon.
- Delete any proposals that cannot be satisfied within the firm horizon (to be regenerated outside the firm horizon after next MRP run).
- Record specific extraordinary items for input to S&OP

Comments: The assumption is that run times and available capacity is correct

HS.0124	Risk and exception management

The practice of sharing the Production Plan with the Sales & Operations Planning Business Process(es) as well as with any 'systems' e.g. ERP system ensures that the established plan is clearly visible up and down stream on the Supply Chain

- Publish the Plan to all stakeholders: short term plan for Production Execution, medium term firm plan for procurement
- Enable S&OP & System visibility of planned incoming receipts in form of released orders and/or firm planned orders

Comments: Key to a plan is that all stakeholders have sight of the same plan! The sharing of the plan through business processes as well as through a system e.g. ERP allows for the stakeholders and the plan to flex and adapt to changes. Customer demands ensure constant change.

Characteristics-Based Forecasting (CBF) is a powerful tool that enables you to forecast demand on both the product and the characteristics level. Configurable products have characteristics, which can take several values. This value assignment is called configuration (of a product variant). Although there may be many possible combinations, not all of these combinations are possible or you do not want to produce several combinations. In characteristics-based forecasting, you can produce demand plans for combinations of characteristic values or for individual values. You generally restrict the characteristics used in CBF to those that are important for planning purposes.

Example:

Characteristics and values of a car: Color: White, red, blue, black Transmission: Stick shift, automatic gear Fuel type: Regular, Diesel There are constraints between characteristic values. Some combinations are not allowed. In the above car example, there may be no Fuel type = Diesel allowed, if Transmission = automatic gear is selected, whereas Fuel type = Regular is allowed for transmissions. Characteristic-based forecast allows forecasting on characteristic values. Supply is later calculated also based on components derived from these values. Example of a characteristic-based for the above car: Demand total for cars forecasted for next month: 1000 each Color: White 20%, red 10%, blue 20%, black 50% Transmission: Stick shift: 60%, automatic gear 40% Fuel type: Regular 80%, Diesel 20% Planning would be inconsistent if constraints are violated in the percentages. In order to avoid such inconsistencies, characteristic-based forecast allows optionally defining partial combinations and forecasting them. Example of a 3 partial combinations for the above car: Stick shift transmission with regular fuel: 40% Stick shift transmission with Diesel: 20% Automatic gear transmission with regular fuel: 40% Note that the Color is not part of the combination because it is not constrained by the other characteristics. Based on the total number forecast and the percentages behind characteristic values and combinations, supply planning can plan supply of components, reserve machine capacity, etc.

The accuracy of the bills of material has a major impact on the accuracy of the financial statements. If the Bill of Materials for products are incorrect the parts assumed to be in the products will be incorrect which means that product costs will be wrong too.

The best way to implement bill audits is to tie them to the production schedule so that any products scheduled to be manufactured in the near future are reviewed the most frequently. This focuses attention on those bills with the highest usage though it is still necessary to review the bills of less frequently used products from time to time.~The engineering staff the production scheduler the warehouse staff and the production staff can conduct the review. The reason for using so many people is that they all have input into the process. The engineering staff has the best overall knowledge of the product while the production scheduler is the most aware of production shortages caused by problems with the bills and the warehouse staff sees components returned to the warehouse that were listed in the bills but not actually used; the production staff must assemble products and knows from practical experience which bills are inaccurate. Thus a variety of people (preferably all of them) can influence the bill of material review process.

Measuring a bill of material includes several steps:

- Ensure that the correct part quantities are listed
- Verify that parts should be included in the product at all
- Ensure correct subassemblies roll up into the final product

Accurately managing your bills of materials (BOMs) confirms that a company is building the right product with the right parts meaning fewer errors less scrap and rework higher quality and better cost control.

Notes: While this is considered a best practice experience suggests that some manufacturing organizations do not always adopt routine reviews of BOMs. Errors are usually detected when other supply chain risks emerge i.e not enough product ordered incorrect product ordered.

The practice of considering the following key points at the point of planning rather than at the point of make; Distribution channels Locations from/to Mode of transport Paperwork required (legislative - e.g hazardous goods) Any Duties/Taxes (as a cost) Warehouse strategy - is there enough capacity to stock materials what affect will this have on my purchasing strategy with the supplier. Should I obtain additional storage.

The Logistics and warehouse planning process need to be a subset of the overall Supply Chain planning process that includes MRP (Material Requirement Planning) and DRP (Distribution requirements planning). The input to the warehouse and logistics planning will need to flow from the overall Supply chain plan.

Notes: Additional costs may occur through failure to consider this subject as early on in the planning phase as possible. Experience to date suggests that many organizations undertake this practice just before the deliver phase.

The practice of identifying suitable suppliers who are able to meet the planned requirements. Consideration is usually given to the following points;

- Is the supplier approved to supply product (aerospace/wind energy/automotive industry driven)?
- Does the supplier have the capability (new opportunity)?
- Does the supplier have capacity?
- What are the current supplier lead times?
- Does the supplier have acceptable performance history?
- Will the supplier need to be qualified?
- What are the indicative prices (this is research and assumes no negotiation)

Once the answers to these questions are determined the purchaser/project team can determine risk and actions required through the planning phase before formal sourcing actions are implemented.

The practice of collecting and aggregating information required for decision-making, reporting and analysis. In computing a data warehouse (DW or DWH) is a database used for reporting and analysis. The data stored in the warehouse are collected from operational systems (such as marketplace, sales etc.). The data may pass through an operational data store for additional operations before they are used in the DW for reporting. The advantages of a data warehouse:

- Maintain data history even if the source transactional systems do not.
- Integrate data from multiple source systems enabling a central view across the enterprise. This benefit is always valuable but particularly so when the organization has grown by merger.
- Improve data quality by providing consistent codes and descriptions flagging or even fixing bad data.
- Present the organization's information consistently.
- Provide a single common data model for all data of interest regardless of the data's source.
- Restructure the data so that it makes sense to the business users.
- Restructure the data so that it delivers excellent query performance even for complex analytic queries without impacting the operational systems.
- Add value to operational business applications notably customer relationship management (CRM) systems.

The typical ETL-based (Extract, Transform, Load) data warehouse uses staging integration and access layers to house its key functions. The staging layer or staging database stores raw data extracted from each of the source data systems. The integration layer integrates the disparate data sets by transforming the data from the staging layer often storing this transformed data in an operational data store (ODS) database. The integrated data is then moved to yet another database often called the data warehouse database where the data is arranged into hierarchal groups often called dimensions and into facts and aggregate facts. The access layer helps users retrieve data.

Strategic sourcing is an institutional procurement process that continuously improves and re-evaluates the purchasing activities of a company. Typical steps in a strategic sourcing process are:

- Assessment of a company's current spend (what is bought where?)
- Assessment of the supply market (who offers what?)
- Total cost analyses (how much does it cost to provide those goods or services?)
- Identification of suitable suppliers
- Development of a procurement/purchasing strategy (where to buy what considering demand and supply situation, while minimizing risk and costs)
 - Multi Source/shared volumes
 - Sub Contract
 - Supplier change
 - In House manufacturing
- Negotiation with suppliers (products, service levels, prices, geographical coverage, etc.)
- Implementation of new supply structure
- Track results and restart assessment (continuous cycle)

Strategic sourcing includes more than the purchasing organization and how they interface with the markets and suppliers they buy from. The best strategic sourcing efforts include an internal component that educates the total organization in ways to interact with and derive optimum value from the supply chain.

Note: This practice sits between supplier research (PLAN) and supplier selection (SOURCE), therefore the boundaries of this task can sometimes be merged with these other tasks. Options can be limited due to other constraints; this can lead to a minimal amount of time being spent on this task. My view is that leading purchasing personnel will always go through this thought process and evaluation to ensure that new opportunities are not missed

A procurement strategy is the planned approach of cost-effectively purchasing a company's required supplies, taking into consideration elements and factors such as the timeline for procurement, the funding and budget, the projected risks and opportunities.

To develop a procurement strategy or sourcing strategy, it is necessary to assess business objectives, available and existing resources and supplies, budget and the timeline. A key is to make sure that every detail contributes towards attaining the company's established goals and objectives. Another key item is to choose to making or creating the materials (or doing procurement outsourcing).

Note: Influences on this practice will relate to how much time is available for the purchaser to implement any such strategy.

A Pick List is a sequential list of all components and materials required to fill a specific production, sales or interplant order. It often specifies the location in the warehouse that allows warehouse personnel to efficiently locate and assemble material for orders ready for shipment and sometimes consolidates requirements from more than one order. The idea is that you pick order items into transport bins for the orders, then pack them, and then schedule the shipments.

A pick list is typically ordered by the location of the items in the warehouse, so that a `picker` is able to go through the warehouse and retrieve the items in the same sequence as the pick list. The Pick List can be as simple as a manually created excel spreadsheet or a report automatically generated by a Warehouse Management system.

Principles and process to continuously improve data quality and accuracy are in place that include clear ownership and accountabilities for data, a defined process executed on a periodic basis to review data quality and conduct root cause corrective action (RCCA).

Data quality accuracy or other metrics should be tracked to assess performance trends. Scope includes data standards, master data management standards and system's application. Roles, responsibilities and ownership of specific data fields identified and resourced.

- Stage 1- Data quality is non-existent or not an organized field of activity in a business. Data and data processing is siloed. "Firefighting mode."
- Stage 2 - Rules for data governance emerge, but the emphasis remains on correcting data issues emphasis remains on correcting data issues
- Stage 3 - Data governance processes are built into the foundation of the business
- Stage 4 - Real-time activities and preventive data quality rules and processes emerge
- Stage 5 - New initiatives are only approved after careful consideration of how the initiatives will impact the existing data infrastructure. Automated policies are in place to ensure that data remains consistent, accurate and reliable throughout the enterprise.

Relevant Metrics (external to SCOR):

$$\text{Master Data Accuracy \%} = \frac{\text{\# of Master Data Records Correct}}{\text{\# of Master Data Records Verified}} \times 100\%$$

$$\text{Data Completion} = \frac{\text{\# of Required Fields Populated}}{\text{\# of Required Fields Verified}} \times 100\%$$

$$\text{Data Consistency \%} = \frac{\text{\# of Data Fields Matching Value and Format}}{\text{\# of Data Fields Verified}} \times 100\%$$

A facility master plan is a document that describes an overall physical development concept through maps and narrative. It provides a framework for the physical environment to include buildings. The Facilities Master Plan document reflects a strategy to provide the facilities that support a company's mission statement. The plan is guided by a vision statement and supporting goals.

The development of the master plan is in cooperation with strategic facility planning and starts with the development of scenarios representing different priorities and criteria. It is best accomplished with input from experts and all stakeholders. Components of a facility master plan include:

- Regulatory analysis
- Security strategy
- Phasing plans
- Cost projections
- Environmental design

The master plan can include varying levels of detail but usually includes;

- Zoning, regulation, covenant assessments
- Space standards/benchmarks descriptions
- Space use program
- Workflow analysis
- Engineering assessment/plan
- Site plan
- Architectural image concepts
- Long term maintenance plan
- Construction estimates
- Phasing or sequencing plan

The master plan is often summarized as a colored site drawing and/or timeline of projects.

The task management process is used to determine the resources and sequence of tasks for complex delivery processes including aggregation and staging of products for shipment. Task Management allows the company to forecast manpower, skill set and capital equipment needs to comply with committed shipment dates.

Effective task management supposes managing all aspects of a task, including its status, priority, time, human and financial resources assignments, recurrences, and notifications. These can be lumped together broadly into the basic activities of task management.

- As a discipline, task management embraces several key activities including:
- Creative activities such as task planning, brainstorming, creation, elaboration, clarification, organization, reduction, targeting and preliminary prioritization.
- Functional activities regarding personnel, sales, quality or other management areas, for the ultimate purpose of ensuring production of final goods and services for delivery to customers.
- Project activities pertaining to planning and time and costs reporting.
- Service activities pertain to client and internal company services provision, including customer relationship management and knowledge management.
- Performance activities pertain to tracking performance and fulfillment of assigned tasks.
- Report activities pertain to the presentation of information regarding the other five activities listed, including graphical display.

Task management software tools abound in the marketplace. Some are free; others exist for enterprise-wide deployment purposes. Some boast enterprise-wide task creation, visualization and notifications capabilities - among others - scalable to small, medium and Fortune 100 size companies, from individual projects to ongoing corporate task management.

Predictive Maintenance or condition-based maintenance attempts to evaluate the condition of equipment by performing periodic or continuous (online) equipment condition monitoring. The ultimate goal of Predictive Maintenance is to perform maintenance at a scheduled point in time when the maintenance activity is most cost-effective and before the equipment loses performance within a threshold. This is in contrast to time- and/or operation count-based maintenance where a piece of equipment gets maintained whether it needs it or not. Time-based maintenance is labor intensive ineffective in identifying problems that develop between scheduled inspections and is not cost-effective.

The 'predictive' component of predictive maintenance stems from the goal of predicting the future trend of the equipment's condition. This approach uses principles of statistical process control to determine at what point in the future maintenance activities will be appropriate.

Most Predictive Maintenance inspections are performed while equipment is in service thereby minimizing disruption of normal system operations. Adoption of Predictive Maintenance can result in substantial cost savings and higher system reliability.

Distributed Order Management plans the shipment of materials and finished goods from multiple distribution points and/or multiple suppliers to customer locations. Distributed Order Management helps reduce lead times, lower the cost of transportation and meet non-forecasted demand by providing multiple delivery options to the planner.

Distributed order management plays key roles in customer experience by centrally brokering and managing orders from multiple sales channels to ensure customer orders are executed to customer expectations. The order management system also provides a 360-degree view of all of the customer's purchases across all of the seller's channels which improves supply chain efficiency as well as an improved customer experience.

The development of technical data is an inherent part of the engineering design, development and manufacturing of products. New business practices that use digital methodologies and products have demonstrated cost savings, process improvements, and expanded capability for interoperability. This include the utilization of Portable Maintenance Aids (PMAs), Integrated Electronic Technical Manuals (IETMs), Job Performance Aids (JPAs) and other forms of electronic Technical Orders and Product Specifications to aid in identifying product condition. These tools should have a tie to the PLM/Configuration Management system to ensure any changes to product or system specifications are utilized in evaluating the product condition.

A cross-functional team is a group of people with different functional expertise working toward a common goal. It may include people from sales and marketing, finance, operations, human resources and IT departments. Typically it includes employees from all levels of an organization. Members may also come from outside an organization (in particular from suppliers, key customers or consultants).

Cross-functional teams often function as self-directed teams responding to broad but not specific directives. Decision making within a team may depend on consensus but often is led by a manager/coach/team leader.

Processes

sE4

Manage Supply Chain Human Resources

The functional group responsible for accepting and managing the customer quotation should have the information and systems that would support the following capabilities:

- Ability to provide immediate pricing and associated pricing discounts for various quantity breaks (for both similar items and mixed orders, if applicable).
- Ability to provide approximate lead time estimates on all items/order lines. This would include fulfillment estimates according to original customer requirement, as well as adjusted/negotiated dates, if applicable.
- Ability to quote pricing and lead time not only on requested items/quantities, but also the ability to provide alternative quotations without losing or altering the original quotation.
- Ability to convert initial or subsequent quotations directly into firm orders.
- Ability to identify and provide alternative quotations based on additional configurations that would provide similar performance at lower cost, etc.

Typically an organization's customer service group would manage this practice. However, in the event that a functional group other than the customer service or order management group is responsible for this process element (e.g. commercial pricing group, etc.), then the ability to seamlessly move customer quotes between internal functions is also a critical element of this practice.

Transportation Management System (TMS) applications are used by major corporations to optimize plans and manage inbound and outbound logistics. The TMS controls and automates the entire logistics process end to end, reducing errors and assuring the best price and routing are always selected. TMS capabilities include:

- Rate and service data base to shop and optimize shipment
- Shipment creation, either manual or electronically directly from ERP system
- Electronically tender shipment to carrier
- Electronically prepare all necessary trade documents
- Real-time shipment visibility across carriers via web-based tracking from shipment acceptance to final delivery
- Company routing guide instructions
- Centralized data repository for all shipments regardless of carrier or mode
- Coordination of manufacturing scheduling and shipment optimization
- Provide visibility

A Transportation Management System generally is part of or integrated with the ERP (Enterprise Resource Planning) system.

Expedited logistics (or express logistics) is the process that occurs when delivery plans are revised as a result of delays in shipments, critical orders inside standard lead times or the requirement for replacement parts. The standard practiced used in most industries is telephone or fax individual carriers (ocean, trucking and air) to determine the best price to delivery combination that fits within the delivery schedule. The change in standard process results in substantial increases in transportation costs and time.

Production flexibility, and being able to produce different mixes or a variety of products quickly, without sacrificing efficiency at lower volumes of production, is one of the core tenets of being make to order. The Generation of Dynamic Bills of Materials (using IT Application) based on customer order requirements & specification, product and customer rules allows not only the substitution of different raw material types on the fly, but also allows the flexibility of complete reinvention for once off production requirement. This Bill of materials drives the manufacturing/assembly process, shop floor scheduling, inventory planning, resource allocation and cost calculations and is used for a single order only.

Vendor-managed inventory (VMI) is a family of business models in which the buyer of a product provides certain information to a supplier of that product and the supplier takes full responsibility for maintaining an agreed inventory of the material usually at the buyer's consumption location (usually a store). A third-party logistics provider can also be involved to make sure that the buyer has the required level of inventory by adjusting the demand and supply gaps.

VMI makes it less likely that a business will unintentionally become out of stock of a good and reduces inventory in the supply chain.

One of the keys to making VMI work is shared risk. In some cases if the inventory does not sell the vendor (supplier) will repurchase the product from the buyer. In other cases the product may be in the possession of the buyer but is not owned by the buyer until the sale takes place meaning that the buyer simply houses (and assists with the sale of) the product in exchange for a predetermined commission or profit (sometimes referred to as consignment stock).

VMI helps foster a closer understanding between the supplier and manufacturer by using Electronic Data Interchange formats EDI software and statistical methodologies to forecast and maintain correct inventory in the supply chain.

Automated supply chain management systems allow verification and identification of overshipped product at time of receiving. Comparison against Purchase Order tolerance levels is normally done automatically by the system. This information (i.e., the quantity flagged by the system as excess) can be used to take action based on policies and business rules related to the return process. Depending on company policies and agreement between the parties involved, overshipped product can be shipped back immediately or sent to a return location identified to continue with the next step in the process.

Notes: Overshipments (receipt of material exceeding the order quantity, inclusive of tolerances in the PO) are a receiving issue against PO requirements.

Collaboration between supply chain partners can be facilitated using a supply chain visibility system. This allows supplier to see requirements and inventory levels at customer site, highlighting any potential excess inventory. Similarly, customer can easily identify supply/demand variations and take necessary action to return excess inventory if needed.

Notes: This should be considered a standard, or perhaps declining practice due to its after-the-fact identification of excess to be returned. It would be emerging if the process involved avoidance of excess via close linkage of information between supplier and customer. A KanBan approach is one way to provide just-in-time material while pro-actively minimizing excess inventory exposure.

AM.2.2	Inventory Days of Supply

The practice of recovering the cost of materials and incremental cost occurred to return, repair and resend a return part to the supplier of the failing component. When a defective product is returned by a customer, an analysis to identify the source of the problem usually takes place. If the defect is determined to be related with to a component purchased from a vendor, the process of recovering part or all of the cost from the vendor is typically called 'Vendor Recovery'. Further collaboration with vendor to prevent similar instances in the future, or improve quality can also be considered.

Notes: A prerequisite for this practice is a written agreement with affected suppliers that includes details related to the warrantable conditions, excluded items (if any, such as expendables), the period of warranty coverage, when such period commences, and the extent in which some or all of the buyer's associated direct and indirect costs are reimbursed by the supplier.

In order to better facilitate return process, and provide additional information about agreed upon return policies, it is common to include return policy together with the shipping documentation. This clearly identifies terms and conditions, and what kind of action should be taken in case of a return.

Notes: This practice is probably best suited for shipment of product intended for end customers, and not component product being shipped to an OEM. Return policies are now more often kept on supplier websites and referenced in documentation provided.

Products that are deemed obsolete capital assets have typically not sold in some time, and are at the end of their shelf life. When capital assets become obsolete, wear out or become out-dated, their capital assets should be disposed off.

To identify obsolete inventory, a company should conduct regular inventory review meetings. A manager and an accounting official to attend a meeting to go over expense reports. They should review inventory-ordering information on the company's expense accounts. Payables should be reviewed to find the listing of products purchased by your company. The payables should be sorted by "last-used" date or "where used". Products with no dates listed, or very old dates, are likely part of obsolete inventory. Also, if the inventory does not have a location under the "where used" heading, it will also likely be considered obsolete. After finding obsolete inventory, team members can decide how to move or liquidate the products.

AM.2.5	Supply Chain Fixed Assets
AM.2.8	Inventory
AM.3.8	Average age of Excess Inventory

The practice of requesting prices from a number of suppliers for a particular product or service. The prices are compared to the existing supplier in order to determine whether the current price paid is representative of the market/industry.

An informal research approach by the purchaser. If an existing supplier contract is for many different materials/ or service requirements, usually only a sample of those materials/service requirements are used to test the market price. When agreeing a medium term, formal contract with a supplier it is useful to include a clause that allows the purchaser the opportunity to benchmark against the market, which in turn allows the opportunity to discuss pricing concerns with the existing supplier.

Notes: Caution must be taken when undertaking a benchmark exercise as spot rate analysis based on a selection of products does not always return comparable results.

The practice of issuing an invitation to tender to a number of suppliers who have the capability to supply a product or service. The tender can also be advertised for any qualified supplier to participate in, this is more common in the public sector.

This practice creates competition and enables the purchaser the opportunity to compare and evaluate a number of suppliers on comparable data. Widely used to purchase services and in some countries to meet competition/purchasing standards. More commonly used where multiple suppliers exist.

A comprehensive tender document will include the terms and conditions of the tender, the purchasers company terms and conditions, the specification of services or materials required and a forecast of service quantity requirements.

A transparent purchasing contract method that demonstrates due diligence to any external auditor.

Comments: This task can be quite time consuming however investment in this practice is important if the contract is a medium term contract and of high value.

Total Preventive Maintenance (TPM) is a production management approach that places the responsibility for routine maintenance on the workers who operate the machinery rather than employing separate maintenance personnel for that function. It encompasses both breakdown maintenance policy that involves dealing with problems as they occur and attempting to reduce their impact on operations and preventive maintenance policy that involves using such measures as inspecting cleaning adjusting and replacing worn parts to prevent breakdowns from occurring in the first place.

Preventive maintenance is performed periodically in order to reduce the incidence of equipment failure and the costs associated with it. It should be scheduled to avoid interfering with production. Common methods of planning preventive maintenance are based on the passage of time on the amount of usage the equipment receives and on an as-needed basis when problems are uncovered through inspections. Ideally preventive maintenance will take place just before failure occurs in order to maximize the time that equipment is in use between scheduled maintenance activities.

The decision of how much maintenance to perform involves the age and condition of the equipment the complexity of technology used the type of production process and other factors. For example managers would tend to perform more preventive maintenance on older machines because new ones have only a slight risk of breakdown and need less work to stay in good condition. It is also important to perform routine maintenance prior to beginning a particularly large or important production run.

In TPM production employees are trained in both operating procedures and routine maintenance of equipment. They perform regular inspections of the machinery they operate and replace parts that have become worn through use before they fail. Since the production employees spend so much time working with the equipment they are likely to pick up small signals that a machine is in need of maintenance. Among the main benefits of TPM is that employees gain a more complete understanding of the functioning of the system. TPM also gives them increased input into their own productivity and the quality of their work.

sE5.1	Schedule Asset Management Activities

The practice of evaluating a supplier. A thorough supplier evaluation process will consider pricing, supplier structure and sustainability, supplier capability, supplier fit with company, acceptable contract terms and conditions.

A robust evaluation toll should be used which attempts to remove as much subjectivity as possible. Weighting can be given to certain evaluation criteria based on the importance to the purchaser. Price, Quality, Culture, Performance, Location etc.

An evaluation committee should jointly agree on the overall evaluation score. Members of the committee should include key stakeholders, purchasers and individuals who may not have a direct interest in the outcome but who are able to ask probing questions and challenge the norm.

This task should not be confused with evaluation of supplier materials (trials).

The management approach focused on addressing performance gaps by the identification and elimination of a limited number of bottlenecks (of a supply chain). Theory of Constraints is based on the following paradigms:

- The purpose (goal) of a business is to "make money, now and in the future"
- The rate of goal achievement is limited by at least one constraining process
- A chain is no stronger than its weakest link

Theory of Constraints recommends five focusing steps of continuous improvement:

- Identify the constraint - find the equipment, people or policy that prevents the supply chain from achieving its goals;
- Decide how to exploit the constraint - how to get the most capacity out of the constrained process;
- Subordinate all processes to the decision in step 2 - align the whole supply chain to support the decision;
- Elevate the constraint - make other major changes needed to break the constraint;
- If, as a result of these steps, the constraint has moved, return to Step 1.

Theory of Constraints implements buffers before constraints to avoid the constrained process is waiting for other processes to complete. Processes with greater variance require larger buffers. (Combination of six sigma - a methodology focused on reducing variance of processes - will have synergistic effects). These buffers are mostly inventory of materials waiting to be processed by the constrained process. In supply chain inserting inventory is generally a hard sell, however the buffer inventory is significantly less than the inventory reduction further downstream.

The Drum-Buffer-Rope is the approach to analyze the manufacturing process:

- Drum - the physical constraint of the supply chain
- Buffer - the buffer that ensure the drum has work
- Rope - the scheduling process that releases orders to the drum one buffer time before due

Theory of Constraints was first introduced by Dr. Eliyahu M. Goldratt. Implementation of Theory of Constraints shifts viewing the whole as dissected silos, to identifying and maximizing the system's intrinsic flow.

The practice where the planning of inventory levels and the scheduling of deliveries to the customer is performed by the supplier of the materials or goods. VMI implementations require a Make-to-Stock inventory strategy for the goods or materials managed using VMI. Vendor Managed Inventory requires contractual agreements that stipulate the service level agreements and/or desired inventory levels.

Trust is a major requirement of VMI, for both supplier and customer in the relationship. Supplier may need to disclose lead times and VMI processes. Customers may need to disclose historic, current and future demand - including trends and seasonality. Implementation includes establishing process documentation, modification of contractual agreements and information technology changes.

Notes: VMI by itself does not change the point of ownership transfer, nor does it change the location of the inventory. VMI changes the responsibility of the process that determines when materials/goods need to be replenished and the scheduling of the replenishments. The supplier is the manager of the inventory. Vendor Managed Inventory can be combined with Outsourced Warehousing and Consignment Inventory to increase benefits. For example if the supplier is both manager and owner of the inventory (i.e. VMI plus Consignment Inventory) then it may be referred to as `Vendor Owned Inventory` or VOI.

Related inventory management practices: Consignment Inventory, Outsourced Warehousing

The practice of requiring the issuance and usage of a return authorization number to (ship and accept the) return of goods or materials. This practice requires the policy: 'No return without a return authorization number'. The Return Authorization Required practice improves warranty reporting, reduces the risk of fraud and improves the overall cost related to return processes and fraud.

Alternative names: Return Material Authorization, Return Merchandize Authorization, Goods Return Authorization

Notes: The request for a return authorization number is generally made by the customer or consumer. Return Authorization Required practice can be automated using bar coding technology.

Proactive Return Authorization is the practice where a return authorization number is issued at the time of ordering or shipment of the goods to the customer. The proactive issuance of a return authorization number reduces the time, cost and possible errors associated with the process to receive and validate a return authorization request and issuing the authorization. This practice requires the policy: "No return without a return authorization number".

Notes: The customer does not need to make a request for a return authorization number as the supplier is providing the number by default or proactively based on a certain logic. E.g. Amazon shipments include a return authorization and return shipping label.

Remote Return Authorization is the practice where identification of the state of materials/merchandise and the disposition decision takes place at the customer or in the store (on behalf of the supplier). Making the disposition decision at the customer or in-store eliminates the cost of shipping and handling of the materials/merchandise for materials/merchandise do not need to be returned and/or disposed.

Implementation of the remote return authorization practice requires the clear establishment and communication of rules and instructions for the identification, disposition and authorization of returns, replacement, repair and/or reimbursement. This practice generally imposes reporting requirements on the party that performs the remote inspection and authorization.

The practice of issuing notices to consumers/customers requesting the return of goods or materials due to possible defects or damages to products shipped. This includes notifying distributors, intermediaries or channel partners that may hold these goods for resale purposes. The purpose of preventive returns is to protect name brand, avoid injury or disruption of operations of the supply chain itself or its customers and avoid associated cost.

Examples of preventive returns include recalls in the automotive, electronics and food industries.

Notes: This practice may in certain cases be required by law. Not all preventive returns are required by law though. The severity and risk strategy of the company may determine the application of preventive returns.

The practice of issuing a 12 month rolling picture of demand to the supplier. The schedule usually includes a fixed window of time where no change should be made, a flexible window where it is acceptable to change +/- qty or delivery time and a forecast window which gives the supplier an idea of future plans. The schedules are reviewed regularly i.e monthly. This collaboration may enable vendors to provide a higher level of service at a lower cost.

Usually a formal contract has been agreed with the supplier on the price, specification and delivery volumes, and so strategic purchasing focus on the commercial points and an operational purchaser focuses on managing the order requirements and demands of production. Proven to be two very different skill sets, but equally important.

The expectation is that lead times become reduced as suppliers are able to forward plan resources, with less surprises. Used in industries which have regular purchases of product. Beneficial to those industries that must manage variation and changes.

A risk register captures all the risk exposure for a supply chain, once the risks are identified and assessed in terms of probability of occurrence and impact. While developing this register, organization often follow the practice of grouping of risk like operational risks, technical risks, financial risks, legal risks, brand risk, environment risk, safety & health risk etc. and then identify specific supply chain risk and capture the impact of these specific risks on the key groups.

A risk matrix is then developed by plotting probability of occurrence on one axis and impact on the other axis. For each supply chain risk identified, populating it on the matrix will help arrive at a risk rating for each risk which in turn helps in prioritizing.

The following is an example of identifying risk, assessing them and categorizing them into a Risk Register. The cost impact magnitudes, probability breakdowns and category assignments can be adjusted based on your company size and risk complexity.

ID	Process	Risk Identification (Event)	Risk Assessment			Category
			Probability	Impact	VaR	
1	Source	Plastic Strip supplier shut down by labor strike	10.0%	\$5,000	\$500	Cat 5 (G)
2	Plan	Out of stock incidents with the distributors	25.0%	\$1,000	\$250	Cat 5 (G)

Real time package tracking refers to technology that allows packages and other types of assets including vehicles to be tracked utilizing GPS, cellular phone or other networks. A device such as an RFID or M2M antenna is attached to the package/asset. Typically customers can login to a web interface and determine the location of their packages including information such as current trajectory and travel history vehicle speed package temperature and level of light exposure.

Alerts may be established that notify customers or owners when a package has been picked up is in transit and has been successfully delivered. Utilizing self-powered GPS trackers placed either individually in packages sporadically throughout a related shipment or within courier satchels and vehicles Customers can track the exact location of their shipment at any given time. When GPS signals are unavailable tracking devices automatically default to the cellular network and relay their positions through the closest cell tower.

Production-related ADC is an enabler for many of the MAKE level 3 and 4 process elements. Similar to other types of ADC that support other SCOR processes (e.g. DELIVER RETURN etc.) the actual data capture format/technology can take many forms. The most common format includes bar codes associated with a bill of materials (BOM) or production order. The BOM is scanned at multiple points in the process to track multiple statuses and performance measures.

Common examples of MAKE process data captured in ADC include the following:

- Inventory issuances/allocations and on-hand levels
- Order completion status~Labor requirements/tracking
- Process cycle and dwell times~Asset efficiency data
- Quality data

Data from this type of ADC is transacted (both transmitted and received) on a real-time/or near real-time basis in order to support other ERP functionality (e.g. order and inventorymgmt planning/scheduling etc.)

The term standard operating procedure, or SOP, is used in a variety of different contexts, including healthcare, aviation, education, industry, and military.

The U.S. military sometimes uses the term Standing — rather than Standard — Operating Procedure, because a military SOP refers to a unit's unique procedures, which are not necessarily standard to another unit. "Standard" could imply that there is a one (standard) procedure to be used across all units.

An SOP is a written document or instruction detailing all steps and activities of a process or procedure. An SOP provides employees with a reference to common business practices, activities, or tasks. New employees use an SOP to answer questions without having to interrupt supervisors to ask how an operation is performed. The international quality standard ISO 9001 essentially requires the determination of processes (documented as standard operating procedures) used in any manufacturing process that could affect the quality of the product.

Well-documented SOPs help ensure consistency in process execution and provides an effective tool for documenting process steps and their sequence, business rules, best practices, and exception handling, as well as who is responsible.

The CPFR® reference model provides a general framework for the collaborative aspects of planning, forecasting and replenishment processes. The model is considered a 'guideline' for trading partner collaboration which should be tailored specially for the industry and company readiness and maturity.

CPFR defines eight collaboration tasks:

- Collaboration Arrangement is the process of setting the business goals for the relationship defining the scope of collaboration and assigning roles responsibilities checkpoints and escalation procedures.
- The Joint Business Plan then identifies the significant events that affect supply and demand in the planning period such as promotions inventory policy changes store openings/closings and product introductions.
- Sales Forecasting projects consumer demand at the point of sale.
- Order Planning/Forecasting determines future product ordering and delivery requirements based upon the sales forecast inventory positions transit lead times and other factors.
- Order Generation transitions forecasts to firm demand.
- Order Fulfillment is the process of producing shipping delivering and stocking products for consumer purchase.
- Exception Management is the active monitoring of planning and operations for out-of-bounds conditions.
- Performance Assessment calculates key metrics to evaluate the achievement of business goals uncover trends or develop alternative strategies.

Based on this general framework CPFR addresses collaboration scenarios (such as replenishment collaboration or collaborative assortment planning), collaboration roles (assigning responsibilities for the collaboration activities) and organizational implications for the partnering companies.

CPFR® is a registered trademark of VICS.org

Just in time (JIT) is a production strategy that strives to improve a business return on investment by reducing in-process inventory and associated carrying costs. Just-in-time is also known as the Toyota Production System. Just-In-Time processes rely on signals or Kanban between different points in the process which tell production when to make the next part or tell a supplier when to make the next delivery. Just-In-Time focuses on making materials or products available just before they are needed.

Kanban are usually 'tickets' but can be simple visual signals such as the presence or absence of a part on a shelf. Kanbans are constructed to maximize frequency of delivery and minimize inventory. Implemented correctly JIT focuses on continuous improvement and can improve a manufacturing organization's return on investment quality and efficiency. To achieve continuous improvement key areas of focus could be flow employee involvement and quality.

Notes:

Just-In-Time like Lean Manufacturing remove inventory buffers from the system. When a shortage or unpredicted delay occurs JIT opponents say this may negatively impact the Agility of a JIT production process. In recent years manufacturers have continued to try to hone forecasting methods such as applying a trailing 13-week average as a better predictor for JIT planning, however some research demonstrates that basing JIT on the presumption of stability is inherently flawed.

Processes

sE7	Manage Supply Chain Network

Make to Order approach is utilized in cases of high value and highly customized items. This approach originated from the high holding cost for raw material WIP and finished goods for highly technology oriented products like automobile computer servers medical and weather forecasting machinery and other industries. Make to Order strategy is adopted to deliver against the specifications of a customer Order.

It calls for technical skills and know-how to develop a supplier network to identify the companies suitable for Make to Order and Make to Stock scenario vendors. Besides it is difficult to identify the point where stock is a part of Make to Order and not included as “make to Stock” inventory. This point is called decoupling point.

Goods Receipt: Made to Order good receipt may be calculated back from the customer required date of the materials or Supplier delivery dates from the point of view of finished goods the model may work as like this:

Goods Receiving Date of the raw material in the store = Customer expected date - (Transport lead time of the finished good + Quality inspection time for the finished goods + Shipping time of the finished goods + Manufacturing time of the FG + receiving time of Raw materials in the store)

The point of view of the Raw materials receiving from Supplier delivery dates

Goods Receiving Date of the raw material in the store = (Delivery date on the purchase Order - Transportation lead time of the Raw materials - GR processing time in the Raw material store)

Here the inspection of raw materials is considered at raw material supplier firm. Few related aspects to Goods receipt in Make to Order approach are:

- Production Line Sequencing
- Lot Tracking and Goods Inspection
- Manufacturing and scheduling count on Production Line Sequencing.

The scope of Material requirement planning in all the advanced ERPs like SAP, Oracle, etc, give effective ways to schedule manufacturing for Make to Order stocks.

Lot Tracking -- Various industries like biotech/pharmaceuticals foods chemicals and automobile ancillary track their products with lot/batch numbers. We can find on the foil of a pharma products a Batch/Lot no. The lot number allows the manufacturer to track a batch of the product which was produced in a manufacturing run or at a particular time in case there are quality or warranty issues in future.

All the advanced ERPs Like SAP Oracle apps etc enables the business to create or use lot numbers and associate them with your inventory items when the inventory is received or manufactured. It will then track the inventory through sales and shipping and allow business to search for sales orders shipments receipts deliveries with a batch/ lot number.

Goods Inspection -- Pre shipment inspection forms a part of quality assurance between the goods supplier firm and ultimate customer. Some of the aspects that is checked are:

- Quantity of the goods/number of packages
- Quality and make of the products.
- Compliance with the order specification at random or 100% quality check.
- Compliance with the destination country standards.

Comments:

The main advantage of Make-to-Order is the ability to meet the customer order specifications and reduction of risk of raw material, WIP and finished goods stock holding. Demand fluctuations have adverse effect on products made to customer orders causing a reduction of capacity utilization.

To mitigate inventory holding risk for finished goods and raw materials a proactive demand management should be in place to balance Make to Order and Make to stock inventory. There are effective modes like ABC analysis, 80/20 system to analyze and take a decision to maintain the inventory levels to cater to future demand.

The practice of exchanging workflow related documents - such as forecasts, purchase orders, order confirmations, work orders, inventory adjustments, invoices - via electronic standard messages.

EDI stands for Electronic Data Interchange. It is the application-to-application transfer of business documents between computers. The transfer of files requires that the sender and receiver agree upon a standard document format for the document that is to be transmitted. EDI is the electronic communication of business transactions such as orders confirmations and invoices between organizations. Third parties provide EDI services that enable organizations with different equipment to connect. Although interactive access may be a part of it EDI implies direct computer-to-computer transactions into vendors' databases and ordering systems.

An EDI message contains a string of data elements each of which represents a singular fact such as a price product model number and so forth separated by delimiter. The entire string is called a data segment. One or more data segments framed by a header and trailer form a transaction set which is the EDI unit of transmission (equivalent to a message). A transaction set often consists of what would usually be contained in a typical business document or form. The parties who exchange EDI transmissions are referred to as trading partners.

Advantages of EDI:

- Cost savings
- Eliminate repetitive activities
- Time reduction
- Improved customer service

There are a number of key points that makes EDI very different from other forms of paper or electronic communications. Firstly EDI happens between companies -- it is cross enterprise. While the growth in the use of computers and other advanced technologies has been tremendous during the past decades the same trend is beginning to happen between companies. While the technology of EDI can be used internally within an organization by definition EDI is organization to organization.

Lean Manufacturing, Lean Enterprise or Lean Production often simply 'Lean' is a production practice that considers the expenditure of resources for any goal other than the creation of value for the end customer to be wasteful and thus a target for elimination. Working from the perspective of the customer who consumes a product or service 'value' is defined as any action or process that a customer would be willing to pay for.

Lean activities therefore focus on the elimination of waste. There are 7 types of waste to consider:

- Overproduction -- making more than is needed
- Transport -- excessive movement of materials
- Motion -- inefficient movement of people or assets
- Waiting -- underutilization of people
- Inventory -- material lying around unused
- Over processing -- manufacturing to a higher quality standard than required by the customer
- Defects -- time spent correcting defects including the scrap that results and the time that is wasted

The Lean or TPS (Toyota Production System) concept was developed in large part by Toyoda Kiichiro Taiichi Ohno and Toyoda Sakichi following WW II.

One of the measures of purchasing performance is average purchasing volume per supplier. There is a balance to be struck between numbers of supplier for a material vs. negotiation power. Increasing number supplier enhance competition and drive down the prices at the same time too many suppliers will also have negative effects of reducing purchasing volume which reduces interest of supplier and quantity based benefits as well needed more effort from purchasing manager to coordinate with suppliers. Spend analysis is a very good starting point to get a guidelines for optimum number of supplier count.

The practice of making inventory available at the customer premises, while the vendor carries the cost of ownership and liability of these materials or goods. The customer assumes ownership and liability at time of consumption or sale of these materials or goods. Payment is made on the basis of the contractually agreed terms following the moment of assuming ownership. Generally the contractual agreement documents both the terms and the moment/trigger of assuming ownership by the customer.

Consignment (or Vendor Owned Inventory) may be combined with VMI (Vendor Managed Inventory).

The practice of implementing a structured process improvement framework, leveraging the best tools and techniques applicable to the problem at hand.

Lean Manufacturing, Six Sigma, and SCOR are independent methodologies that are being applied to help companies improve their operations. The norm for most companies is usually to choose one of the 3 and exclude the others due to cost, complexity, or familiarity factors. Choosing only one means however we must deal with tradeoffs since each methodology has something unique to offer. SCOR is the ideal supply chain analysis tool and offers an efficient way to identify improvement opportunities. These opportunities can then be used as the input to Lean or Six Sigma project portfolios and can help ensure results that impact the bottom line.

A Document Management System (DMS) is a computer system (or set of computer programs) used to track and store electronic documents and/or images of paper documents. Document Management Systems are generally capable of keeping track of different versions created by different users (revision control/tracking). Document Management Systems are considered a component of Enterprise Content Management (ECM) systems and related to digital asset management, document imaging, workflow systems and records management systems.

Document Management Systems eliminate the need for managing paper versions of documents (copies in multiple locations, archiving and document retention).

The practice of using electronic systems to track the location of returns within the supply chain allows better Turn Around Time for return and repairs, or replacements. In-transit visibility can show if there are delays or potential shipping issues such as customs, weather delays, or other areas where the return process may be off schedule.

Different technology can be applied to add electronic tracking. The simplest form is barcoding, 2D Barcoding and Unique IDentification (UID), through to the most sophisticated which Active Radio Frequency IDentification (RFID) and Auto-ID data capture (AIDC). Regardless of item identification technology used, an Information Technology system must be set up to track item locations as they are scanned in and display the item location to supply chain analysts.

More sophisticated systems can be set up to do automated analysis of information to immediately identify potential issues. An example may be reviewing transfer cycle times to see if they fall within a certain time limit, and if they are outside a limit then a supply chain analyst would be notified to determine resolution. Setting up business rules and notifications within the tracking systems helps to automate the return process and reduce required manpower.

ETO is a strategy of manufacturing whereby finished goods are manufactured up to the specification of customer orders. It calls for higher lead time to design and manufacture as per exact specifications of the customer. Generally the technique of identifying materials with material numbers and bill of material (list of material in FG, WIP and all sublevels), routing number and concept of work centers are utilized to manufacture these complex and high tech products. Advanced ERP systems offer the option of utilizing these concepts into the manufacturing process. Medical detection instruments photo detectors system monitoring equipment are typical example of ETO products.

The practice of establishing a formal process to continuously monitor the changes in probability or impact of risk events.

Once areas of risk have been identified, an organization needs to monitor their internal and external environment. Risk monitoring:

- Helps to predict when risky events are becoming more likely
- Helps identify new risks (link to Supply Chain Risk Identification best practice)
- Continuously assesses the effectiveness of a Supply Chain Risk Management (SCRM) program

Real time metrics and periodic reports provide decision makers knowledge of upcoming risks. Statistical analysis of key metrics can reveal trends. Visibility into supplier and customer metrics increases the ability to monitor. Reports on risk monitoring can be combined with existing management reviews and meetings. Monitoring can also include monitoring qualitative sources of information such as news or weather reports to identify events that are precursors to risks.

It is important to monitor indicators that would appear early in a risk event or, better, even before it occurs by indicating an increasing likelihood. If monitoring only reveals a risk well after its first occurrence, it will likely be too late to adequately respond to it.

Monitoring can also be used to test the effectiveness of risk controls. If a plan to mitigate or prevent a risk has been implemented, monitoring can check to see if the corresponding metrics show no signs of the risk occurring. The effectiveness of the Supply Chain Risk Management program can be assessed by monitoring three general aspects:

- The risk exposure present in the supply chain - Use Value-at-Risk (VAR) metric
- The portion of risk actively mitigated - Use VAR for risk with active mitigations divided by total VAR
- The ability to respond and adapt to risk events - Use time to recover (TTR) metric

Supply Chain Risk assessment provides management with an understanding of where the greatest risks may exist in order to prioritize resources for risk mitigation and management. Performing such assessments will involve clarifying the nature of the risk, understanding conditions that may lead to the event, knowing how frequently such events have happened or can be expected to happen, and the potential impact of such events. The team can then prioritize addressing the risks. Risk assessment is typically made up of two measures: Probability and Impact.

- **Probability** measures the likelihood that a supply chain interrupting event will occur. With formal probability, a probability of 0 means the event will never occur and a probability of 1 means the event will surely occur. The exact probability may be difficult to determine unless historical data exists that can be used to find the frequency of the event occurring. Alternatively an organization can use a subjective probability, or degree of belief, based on the opinions of experts. A time horizon is necessary to define the probability in a useful way (e.g., the likelihood that an event will occur in the next year or the likelihood that the event will occur in the next 50 years).
- **Impact** measures the consequences on the organization when the event occurs. It can be measured directly, for example in terms of monetary impact. It can also be measured on a scale, for example from zero to one with zero being very little negative consequence, 0.5 being a medium amount of consequence, and 1 (one) being a very severe consequence. Methods for measuring impact include "what-if" simulations, financial models, and opinions of teams of experts. Impact may also be measured in terms of other SCOR metrics besides financials.

Summary risk score – A summary risk score can be calculated for each risk by multiplying the Impact times the Probability to get an expected value of the risk. Then risks can be ranked by risk score. Also the risks can be shown on a map or graph. An example is shown below.

Other methods for assessment include:

- Failure Mode Effects Analysis (FMEA)
- Fault Tree Analysis (FTA)
- Event Tree analysis (ETA)

A risk assessment tool in the form of qualitative and quantitative spreadsheet that can be used by management teams to organize the assessment of risks to an organization. The tool can also contain information on relevant causes of those risks and their assessment, mitigation options and the impact of various mitigation plans. This helps establish standards for the measurement, reporting, and limiting of risk. The tool can contain risk categories from other known best practices such as COSO.

Quantitative Risk Analysis: Tools and Techniques for Assessment

Data Collection:

- **Interviews:** Interviewing techniques are used to quantify the likelihood and impact of risks on project objectives. The information required depends on the type of probability distributions that will be used. For example, the information would be collected on optimistic scenarios (low), pessimistic (high) and more likely for some commonly used distributions, mean and standard deviation for others.
- **Probability distributions:** The continuous probability distributions represent the uncertainty in values, such as duration of schedule activities and costs of project components. The discrete distributions can be used to represent uncertain events, as the result of a test or a possible scenario in a decision tree.

Risk analysis:

- **Sensitivity analysis.** The sensitivity analysis helps determine which risks are greatest potential impacts on supply chain disrupts. It examines the extent to which the uncertainty of each chain element affects the objective being examined when all other uncertain elements are held in their baseline values. Operations Research Methods can use it.
- **Decision tree analysis:** In general, the decision tree analysis is structured using a decision tree diagram that describes a situation that is being considered and the implications of each of the available choices and possible scenarios. It incorporates the cost of each available choice, the probabilities of each scenario and the return of each alternative logical path. The resolution of the decision tree provides the Expected Monetary Value - EMV (or other measure of interest in the organization) for each alternative, when all the awards and subsequent decisions are quantified.
- **Modeling and simulation:** A supply chain simulation uses a model that translates the uncertainties specified at a detailed level for each process potential impact on supply chain objectives and performance planned. Simulations are usually performed using the Monte Carlo technique or specific software available on market. In one simulation, the supply chain model is computed many times and the entries values are randomly chosen from a probability distribution function (example: cost of transportation elements or lead time on schedule activities). The probability function is built by each iteration from the probability distributions of each variable. A probability distribution (example: total cost or delay) is calculated.

Figure 1 shows the interaction among some suggested tools for risks assessment.

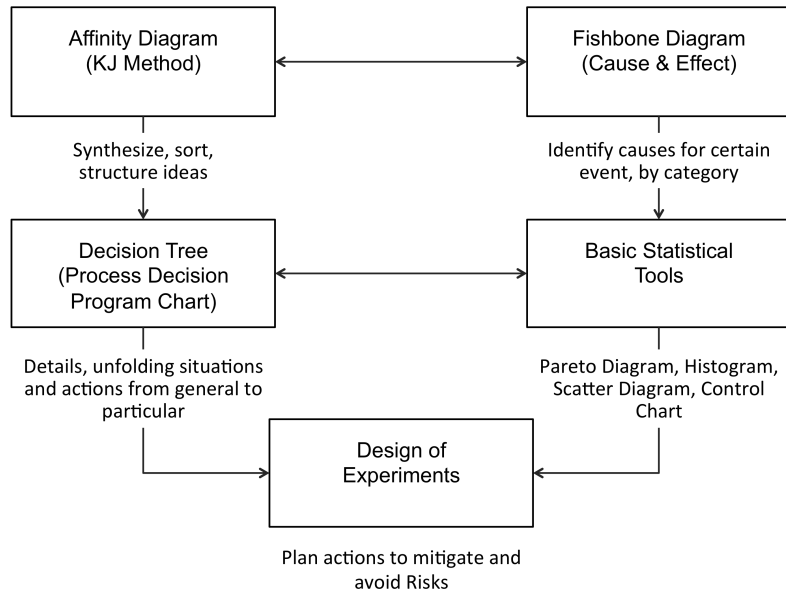

Figure 1: Interaction tools for risks assessment

Notes:

Risk assessment is a tool for quantifying the potential impact of supply chain disruptions and is a key tool for prioritizing mitigation activities. Risk assessment should be used to increase the veracity of a supply chain risk management program and better support resource allocations.

Risk management is widely discussed, but practitioners have differing views of the categories, significance, and how to integrate mitigation plans into the overall project or operational plan. A frequent issue is that management focuses on the highest impact risks, overlooking more frequent occurrences. This tool should help standardize risk management vocabulary and practices within an organization. It can help embed risk management in the operating and project plan.

A best practice is to have project teams update the assessment/plan as project milestones are completed (such as file permits, FEL3, etc.), keeping the risk mitigation plan integrated with overall project by eliminating risk mitigation plans which are no longer pertinent.

Impact on Supply Chain Performance Attributes/Metrics

Attribute	Experienced Impact
Reliability	<p>Good risk assessments will identify the most significant risks to be mitigated and, therefore, decrease the likelihood of disruptions to reliability.</p> <p>Improves reliability by facilitating risk mitigation plans.</p>
Responsiveness	None Identified
Flexibility	Good risk assessments will identify the most significant risks to be mitigated and, therefore, increase the ability to increase flexibility.
Cost	<p>Good risk assessments will identify the most significant risks to be mitigated and, therefore, best allocate cost resources to mitigate risks.</p> <p>Improves cost control by identifying factors which can costs to exceed forecast, and by facilitating risk mitigation plans.</p>
Asset Management	None Identified

Key Best Practice Success Factors

- Technology Features - Some more sophisticated methods of risk assessment involve the use of simulations to derive approximations for the impact of risks. A variety of different types of supply chain simulation software is available and may be used for this purpose. Microsoft Excel software, or equivalent.
- Other Success Factors - Procedure for use of this Best Practice in the context of the firm's vocabulary and policies.

The organization of source processes where the ownership of materials transfers are based on a signal further down in the supply chain (for example Make or Deliver). Whereas the ownership transfer for `regular` inventory is triggered by the receipt and/or verification of the condition of the materials received, the consignment inventory practice is designed to delay the ownership transfer to the completion of an activity such as assembly, production or shipment to the customer. Application of consignment inventory does not lower the physical inventory by default; it impacts ownership of the inventory. Implementation of consignment inventory will free up cash.

Alternative names: Supplier Owned Inventory (SOI), Vendor Owned Inventory (VOI)

Notes: Under Consignment Inventory the responsibility to plan and replenish inventory levels does not transfer to the supplier (see: vendor managed inventory). Nor does the supplier perform any warehousing activities. (see: Outsourced Warehousing). Consignment Inventory can be combined with Outsourced Warehousing and Vendor Managed Inventory to increase the benefits.

---------	----------------------

To avoid overstock situations, we regularly review Slow-moving inventory levels. Slow-moving inventory is defined as the value of those SKUs whose stock level is higher than the total consumption within the last 12 months

Slow-moving inventory can result from various reasons. In most cases, there are constraints in terms of time and quantity of supply which do not match with the demand side of the business (such as minimum lot sizes, constrained equipment, expected shortage of raw-materials etc.)

To evaluate a whole product range, we calculate the total aggregate value of slow-moving inventory. The metric is expressed as total value, number of items affected, and as % of overall stock value. Then, slow-moving items are classified into three reason codes: opportunistic stock, technical (supply) reasons, and market (demand) reasons. Newly introduced items are separated from the measurement.

This practice can be applied for any kind of inventory (raw materials, semi-finished, finished goods), except newly introduced items.

A inventory replenishment technique where a material is replenished based on consumption. Today kanban can be implemented using different 'technologic solutions' but a classic example of kanban is the two-bin-system: One bin is at the point of consumption (for example the factory floor), the second bin is in process to be filled and placed behind the second. Once the first bin is depleted it will be send to be filled and the second bin now becomes the first bin. See illustration.

Example formula to calculate the bin-size for a two-bin system:

$$\text{minimum bin-size} = [\text{projected consumption per time unit}] * [\text{cycle-time to replenish in time units}] / [\text{number of bins}] = 100 \text{ per day} * 3 \text{ days} / 2 \text{ bins} = 150$$

This formula does not deal with variations in projected consumption or cycle-time but illustrates a kanban system does not need to be complex. The minimum bin-size compensates for the cycle-time to refill an empty bin. The number of bins can be increased to reduce the amount of material in each bin. The bin-system described assumes re-usable bins. Example applications of kanban today use kanban-cards to signal the need to replenish stock at the point of use. This may shorten the cycle-time of the process and thus decrease the bin-size. It may create additional packing materials that need to be disposed. ERP systems can replace physical kanban-cards with electronic signals and dashboards.

Alternative names: Two-bin system, three bin system.

Notes:

- Although many sources characterize kanban as a pull-system it is important to understand that kanban in-fact is a to-stock strategy, as the calculation contains a projected demand (read: forecast). The benefit over other replenishment techniques is that no complex or comprehensive planning or scheduling algorithms need to run to trigger replenishment.
- Kanban can be applied in all processes requiring a replenishment signal, this includes Source, Make and Deliver processes.

People	
HS.0058	Inventory Management

A inventory replenishment practice where purchase requisitions or purchase orders are created when inventory for an item drops below the Minimum inventory level. The requisition or order quantity will bring the inventory back to the Maximum inventory level. Min-Max Replenishment methods are generally implemented through automation. Different configuration options exist for Min-Max Replenishment:

- Physical Min-Max Replenishment purely incorporates on-hand inventory, existing customer orders are not included in the calculations. This has characteristics close to a kanban system.
- Logical Min-Max Replenishment nets customer orders from the on-hand inventory. If this inventory net of orders is less than the minimum order quantity a requisition or order will be created. This aligns to Available-to-Promise or Capable-to-Promise practices. Further details may include netting only clean orders or netting all orders. (Clean orders are orders that are free of customer holds, credit holds, etc.

The calculation of the Min-level includes replenishment cycle-time and a buffer (for variability in demand and cycle-time). The Max-level is preferably the Min-level plus EOQ (Economic Order Quantity).

Generally min-max replenishment requires process automation. Re-ordering is triggered by running a re-planning program or report.

Alternative name: Order-point system.

Notes:

- The Minimum inventory level is not the lowest level the inventory will reach in a min-max replenishment system, the name re-order point would fit better. Inventory will continue to drop until the ordered items are received. Similarly the Maximum inventory level will not be achieved for the same reason.
- Min-Max Replenishment works best in an environment where inventory reduction is linear or gradual and replenishment cycle-times have low variability. In environments with large variability in demand and/or replenishment cycle-times this practice may result in stock-outs.
- Min-Max Replenishment applies only in a to-stock inventory strategy.

HS.0058	Inventory Management

The practice of storing information about the history and/or genealogy of a product or material. This may include where it was sourced, the different materials used to make it, the grade of the materials and other product genealogy type information. Lot tracking has three fundamental requirements:

- A means to identify the lot or serial number (identify)
- A system to record milestones for each lot or serial number (record)
- A process to retrieve information by lot or serial number (display)

Lot tracking may make use of barcoding, RFID tags or other visual or electronic methods to identify the lot. Modern ERP systems generally offer lot recording and display functionality. Hardware and operator/handler instructions may be required to read the lot identifiers and communicate the event/milestone to the recording system (ERP).

To establish a lot tracking system it is important to understand what information needs to be collected, where and at what level. The scope of where information is collected may extend beyond the boundaries of your organization. For example: registering users/owners of your products - these users/owners can be your customers-customer. The need for lot tracking may be dictated by regulatory requirements, risk mitigation strategies, process excellence initiatives or customer requirements.

Alternative names: Serial Tracking, Serial/Lot Tracking, Lot History, Lot Tracking & Tracing, Material Traceability

Notes: Lot Tracking is not Electronic Product Coding (EPC) or Universal Product Coding (UPC). EPC and UPC identify the product or material, not the lot, batch or serial number.

Rationalization of inventory at the item/part/SKU number level. Determining how each item should be manufactured (whether stock or make-to-order) or whether it fundamentally would be better to have an outsourced provider make it (buy vs. build) or even if it should be manufactured (special make-order only) can be done more effectively at the lowest level. Some strategies call for these decisions to be made at the product family level. The broader the product family the more frequently the low-level item rationalization should be executed.

Item rationalization is important as any given product moves through its life cycle, defining at which point the product is manufactured (along with how and by whom) is critical in determining the overall cost and value for the product. After the product introduction process an item must be periodically under review to identify the point it is in during the life cycle. A rationalization exercise should identify the most cost effective way to deliver the product to the market throughout its life cycle.

Meet desired customer service levels while maintaining a minimum amount of safety stock.

The standard methods of safety stock planning are used to build stock on hand according to the safety stock values that companies define in their location product master, depending on previous experience. In contrast to model-based safety stock planning, forecast errors are not considered when they use the standard methods. Safety stock values can be maintained as a static or time-dependent value.

The advanced methods of safety stock planning are used to calculate the time-dependent safety stock for finished products and components. In this type of planning, the system takes into account the demand forecasts and forecast errors within the supply chain.

Determine the best short-term strategy to meet demand and to replenish stocking locations.

Distribution Planning enables the user to set certain inventory control parameters (like a safety stock) and calculate the time-phased inventory requirements. This process is also commonly referred to as Distribution Requirements Planning (DRP).

DRP uses several variables:

- the on-hand inventory at the end of a period.
- the backordered demand at the end of a period.
- the required quantity of product needed at the beginning of a period.
- the constrained quantity of product available at the beginning of a period.
- the recommended order quantity at the beginning of a period.

DRP needs the following information:

- the demand in a future period.
- the scheduled receipts at the beginning of a period.
- the safety stock requirement for a period.
- the on-hand inventory at the beginning of a period.

The ABC classification system is the Pareto analysis of a range of inventory items, into three or four inventory categories. The ABC system requires different levels of inventory control for each of the categories. A calculation common method is to use *standard cost x quantity used per time period*. The system can be structured as simple as:

- Calculate the 12 month forecasted spend (at standard cost) for all inventory components.
- Rank the items in descending order.
- The "A" items are the top and should account for 70-80% of the total usage.
- The "B" items make up the next 15-20% of total annual usage.
- The "C" items are the remaining items are the remaining 5-10%
- Excess and Obsolete inventory still on the books can be labeled as "D".

The tables below provide an example for ABC classification.

Table 1 Item Annual Spend

Item	Standard Cost	QTY/year	Total Spend	% Annual Spend
98236	0.10	5000	500.00	3.64
76342	30.00	200	6000.00	43.64
92134	12.00	400	4800.00	34.9
37542	.50	2000	1000.00	7.27
67733	3.00	100	300.00	2.22
19534	1.00	400	400	2.9
39866	2.50	500	750	5.45

Table 2 ABC Classification

Item	% Annual Spend	Classification
76342	43.64	A
92134	34.9	A
37542	7.27	B
39866	5.45	B
98236	3.64	B
67733	2.22	C
19534	2.9	C

ABC classification is used to create the audit sampling tables used during daily cycle counts to monitor perpetual inventories. Root Cause Analysis and Closed Loop Corrective Action are used to correct discrepancies found during the cycle counts and improve system reliability and eliminate stock outs.

Demand Planning is the process used for developing an accurate and comprehensive material forecast. The resulting plan is the sum of all inputs from various stakeholders within the supply chain. Stakeholders include:

- Material planners: provide a statistical view of the plan horizon and inventory analysis
- Suppliers via Buyers: provide inputs on material lead times, problems, and flexibility within the plan horizon
- Customers via Sales: provide upside or downside analysis of requirements outside the statistical forecast
- Marketing: provide an analysis of the impact of special marketing programs and incentives that could impact the forecast
- Engineering and Product Managers: provide the schedules and material requirements for NPI
- Service: provide the inputs for all service part requirements
- Manufacturing: provides the capacity analysis over the plan horizon

Only after the complete analysis and consensus from stakeholders is achieved are their individual demands aggregated and a forecast entered into the ERP system.

HS.0132	Sales and Operations Planning (S&OP)

Mid to Long Term supply chain planning practice which seeks to compare the forecast sales plan to the company resources, (production capacity, people, raw materials) and analyze where any imbalances to the plan might exist.

A continuous practice undertaken on a monthly basis looking forward on a rolling 12 month basis. The focus is generally from month two or three as it is assumed the immediate month is planned. (Time frames will depend on the industry sector)

A strategic tool normally reviewed by the executive/senior management team who are able to make decisions to remove any imbalance such as change to shift patterns, headcount, inventory policies.

A 'plan' scheme of different inventory management practices has been adopted by a company in a mixed model manufacturing environment (ATO - Assemble-to-Order, MTO - Make-to-Order; MTS - Make-to-Stock)

Starting from inventory management practices, five inventory management methods according to type of materials and customer delivery lead time are identified , as shown in the attached excel file. These practices are respond to inventory optimization and the required service level.

The Return Authorization (Return Material Authorization/Return Merchandise Authorization/Goods Return Authorization) process provides the inputs into the reverse logistics plan. Customers provide a detailed description on why the part or product is being returned. Based on the information provided the company can plan in advance one of the following actions:

- Ship a replacement unit to the customer
- Schedule the return unit for warranty repair
- Schedule the return unit an Out of warranty repair
- Return the unit to stock
- Return the unit to vendor

Processes

People	
HS.0031	Customer Repair and Return Policy and Process

Rather than manage returns as part of a service organization or operations many companies turn to outsourced service providers including Contract Manufacturers, EMS providers and Third Party Logistics providers for returns management. The outsourcing partner will plan for part or all of the returns process including:

Returns management issue RA/RMA and provides the customer with shipment instructions
 Schedule disposition of the returned product (repair, refurbish and upgrade)
 Return units under warranty to suppliers
 Plan repackaging and redistribution

Facilities that are singularly focused on returns management can plan for variation by cross training personnel and moving them when needed to meet an increase in returns volume for a specific customer.

HS.0122	Reverse Logistics

The practice of issuing a purchase order for a number of products which are required in the short to mid term. Such orders take into account the supplier lead time.

Specification of product and price quoted by the supplier are included on the purchase order. If a formal contract exists, then the buyers standard terms and conditions including price and lead times will be used from it.

As new demand is identified a new purchase order is created after receiving a price. A routine process usually used to buy products or services that change frequently or are one off purchases.

Cross docking is the practice of unloading materials from an incoming vehicle and loading these materials directly onto outbound vehicles without putting away into the regular storage locations in a warehouse. It involves little or no storing in between and may involve one or more such transfers before reaching final destination.

Thus it reduces time to deliver and some material handling and storage cost.

Rotable Spares Pool is an inventory of serviceable parts that can replace a customer's broken part to increase their recovery time. This practice is particularly useful when it is necessary to minimize customer downtime, especially with complex long lead time repair items.

A challenge with this strategy is ensuring the rotatable spares pool is Form, Fit, Function replaceable with whatever item is being exchanged. Another challenge is potential technology obsolescence which would leave any inventory obsolete and be a cost. It is best to use a rotatable spares pool with a high-demand, long lead time item that is not prone to obsolescence (typically structural items that are frequently broken and repaired).

The practice of assessing items as they are removed for Maintenance, Repair and Overhaul to determine whether repair would cost more than buying a replacement part. Determining this before shipment of the item for repair can reduce transportation costs. Any salvageable components should be taken of the item before scrapping it as additional repair parts.

The identification process may require test equipment and other assessment tools or personnel at the site where BER assessment is being made. Depots are a likely location for this practice to take place because of the availability of tools and personnel.

Section 4

People

Introduction to People

The People section of SCOR introduces standards for managing talent in the supply chain. This skills management framework within SCOR compliments process reference, metrics reference, and practice reference components with an integrated view of supply chain skills in four areas:

- Baseline skills necessary for the overall process area (e.g., Sourcing, or Planning) and for the individual process.
- Critical skills that differentiate leaders in a particular process area from those who only perform at a baseline level.
- Performance measures through SCOR metrics that relate to continuous assessment of job performance in each process area.
- Credentialing of supply chain skills, including training or certification programs, related to the specific process area that tend to indicate superior job performance.

The key elements of the People section are Skills, Experiences, Aptitudes and Trainings.

Skill

Skill is the capacity to deliver pre-determined results with minimal input of time and energy. Skills are further defined by Experiences, Aptitudes, Trainings and Competency levels. Examples of supply chain skills include: Master Scheduling, Import/Export Regulations, Production Planning, and Risk Mitigation.

Experience

Experience is the knowledge or ability acquired by observation or active participation. Experience is obtained by doing the work in a real life environment and undergoing different situations that require different actions. Example experiences include: Cycle Counting, Cross Docking, and Hazardous Materials Handling.

Aptitude

Aptitude is a natural, acquired, learned or developed ability to perform a certain kind of work at a certain level. Example aptitudes include: Accuracy, Analytical, and Natural leadership.

Training

Training develops a skill or type of behavior through instruction. Examples of training includes formal trainings such as SCOR-S certification, but also includes courses and on-the-job training.

Competency

Competency Level describes the level or state of qualification to perform a certain role or tasks. SCOR recognizes 5 commonly accepted competency levels:

- Novice: Untrained beginner, no experience, requires and follows detailed documentation to be able to perform the work.
- Beginner: Performs the work, with limited situational perception.
- Competent: Understands the work and can determine priorities to reach goals.
- Proficient: Oversees all aspects of the work and can prioritize based on situational aspects.
- Expert: Intuitive understanding. Experts can apply experience patterns to new situations.

Each skill is linked to Experiences, Aptitudes and Trainings in SCOR. Competency level is to Skill what Maturity Level is to Process. SCOR does not list or suggest competency levels by skill.

HT.0082	Language skills
HT.0102	Negotiation Skills
HT.0109	Product Specific Training
Practices	
BP.018	ABC Inventory Classification System
BP.148	3-Way Delivery Verification

Knowledge of effective procurement or business development communication techniques to inform and/or solicit potential suppliers regarding product or service specifications.

Processes

sS3.1	Identify Sources of Supply
sS3.2	Select Final Supplier and Negotiate

Experiences

HE.0011	Basic Procurement
HE.0156	Market Knowledge

Trainings

HT.0055	Exception Management
HT.0102	Negotiation Skills
HT.0145	Supply Chain Security

The arrangement of workers, machines, and equipment in which the product being assembled passes consecutively from operation to operation until completed.

Experiences	
HE.0154	Manufacturing engineering
HE.0155	Manufacturing Management

The process (which require's the use of spreadsheets or software) to identify, collect, maintain and track the companies assets.

Processes	
sM1.6	Release Product to Deliver
sE5	Manage Supply Chain Assets
sE7	Manage Supply Chain Network
Experiences	
HE.0002	Accounting
HE.0010	Basic Finance
HE.0046	Cost/Benefit Analysis
HE.0205	Project Management
HE.0298	Utilizing Finance Systems
HE.0311	Written/Verbal Communication
Aptitudes	
HA.0001	Accountable
HA.0007	Business Knowledge & Acumen (Company specific)
HA.0010	Change Management
HA.0023	Diagnostic Information Gathering, Analysis & Problem Solving
HA.0028	Enabling Technology
HA.0038	Initiative
HA.0056	Process Orientation, Systemic and Conceptual Thinking
HA.0065	Teamwork & Collaboration
HA.0072	Written/Verbal Communication
Practices	
BP.012	Lot Tracking

The process of managing and allocating available resources and inventory (at various levels) based on business rules. This would include date, lead time, capacity and inventory management skills.

Processes	
sD1.1	Process Inquiry and Quote
sD1.3	Reserve Inventory and Determine Delivery Date
sD1.4	Consolidate Orders
sD2.1	Process Inquiry and Quote
sD2.3	Reserve Inventory and Determine Delivery Date
sD2.4	Consolidate Orders
Experiences	
HE.0008	ATP logic/calculation
HE.0061	Customer Stocking Agreements Management
HE.0083	Enterprise Resource Planning (ERP)
HE.0131	Inventory Management
HE.0140	Knowledge of business rules concerning customer
HE.0171	On time-shipping and delivery metric logic/calculation
HE.0204	Production Planning/Scheduling
HE.0305	Warehouse/Distribution Management
Aptitudes	
HA.0008	Business minded
HA.0014	Computer Literate
HA.0019	Customer Oriented
HA.0026	Diversity Recognition/Respect
HA.0072	Written/Verbal Communication
Trainings	
HT.0051	Equipment & Machine usage certification (trucks & lifting equipment)
HT.0069	Import/Export Regulations
HT.0084	Lean Manufacturing Training
HT.0109	Product Specific Training
HT.0123	Safety and Environmental Management (industry specific, company specific and country specific)
HT.0145	Supply Chain Security
HT.0155	Warehouse Management

Practices

BP.168

Rotable Spares Pool

Basic working knowledge of the concept of applying or incorporating onto/into a product an optical machine-readable representation of data (bar code) and /or using radio waves with radio-frequency identification tags (RFID) for the purpose of the identification and tracking of that product.

Processes	
sP4.1	Identify, Prioritize and Aggregate Delivery Requirements
sP4.2	Identify, Assess and Aggregate Delivery Resources
sP4.4	Establish Delivery Plans
sP5.1	Assess and Aggregate Return Requirements
sS1.2	Receive Product
sS1.3	Verify Product
sS1.4	Transfer Product
sS2.2	Receive Product
sS2.4	Transfer Product
sS3.4	Receive Product
sS3.5	Verify Product
sS3.6	Transfer Product
sD1.13	Receive and verify Product by Customer
sD2.13	Receive and verify Product by Customer
sD3.13	Receive and verify Product by Customer
Experiences	
HE.0009	Bar Coding/RFID
HE.0083	Enterprise Resource Planning (ERP)
HE.0094	Exception management tool usage/experience
HE.0115	Identification methodologies
HE.0159	Master Data/Document Management
HE.0197	Product Identification System
HE.0208	Quality Management Systems
HE.0212	Receiving and Verifying Product
HE.0293	Transportation/Warehouse Management systems (TMS/WMS)
Aptitudes	
HA.0004	Analytical
HA.0014	Computer Literate
Trainings	
HT.0006	APICS CPIM

HT.0012	Basic legal process (embargo, black list)
HT.0013	Basic Science
HT.0014	Basic Supply Chain Finance
HT.0016	Business Ethics/Conduct training
HT.0035	Credit Management
HT.0052	ERP Systems Training
HT.0068	IFRS/US GAAP revenue recognition
HT.0082	Language skills
HT.0096	Microsoft Project
HT.0102	Negotiation Skills
HT.0109	Product Specific Training
HT.0112	Project Management
HT.0123	Safety and Environmental Management (industry specific, company specific and country specific)
HT.0145	Supply Chain Security
Practices	
BP.012	Lot Tracking
BP.089	Perfect Pick Put away
BP.167	Electronic Returns Tracking

Working knowledge and ability to effectively interpret and communicate general financial accounting practices and principles which maintain company and regulatory compliance.

Processes	
sP2.3	Balance Product Resources with Product Requirements
sS3.1	Identify Sources of Supply
sS3.2	Select Final Supplier and Negotiate
sS3.3	Schedule Product Deliveries
sE2	Manage Performance
Experiences	
HE.0004	Advanced Financial Accounting Principles
HE.0010	Basic Finance
HE.0047	Cost/Price Analysis
HE.0101	Financial Collaboration
HE.0102	Financial Planning
HE.0230	Sales and Operations Planning (S&OP)
HE.0298	Utilizing Finance Systems
Aptitudes

HT.0126	SCOR
HT.0145	Supply Chain Security
HT.0152	Transportation planning
HT.0155	Warehouse Management
Practices	
BP.168	Rotable Spares Pool

Working knowledge of the process of capturing and comparing one's own business processes and performance metrics to industry peers and/or best practices from other industries. Typical measures include quality, time, and cost, with the goal of closing performance gaps and doing things better, faster, and cheaper.

Processes	
sS1.1	Schedule Product Deliveries
sS2.1	Schedule Product Deliveries
sS3.2	Select Final Supplier and Negotiate
sS3.3	Schedule Product Deliveries
sE2	Manage Performance
sE7	Manage Supply Chain Network
Experiences	
HE.0185	Performance Reporting System/ERP System
HE.0244	Six Sigma
Trainings	
HT.0112	Project Management
Practices	
BP.131	Alternative Supplier Benchmarking

Working knowledge of the procurement process for soliciting, issuing and administering "open-ended" (period for performance) type purchase orders or contracts which combine and group numerous line items of (generally) like products onto a purchase order or contract.

Processes

sS2.2	Receive Product
-------	-----------------

Experiences

HE.0167	Negotiation
---------	-------------

Practices

BP.145	Vendor Collaboration
--------	----------------------

Analyzing a product installation schedule against the constraints and requirements in order to ensure feasibility to effectively and efficiently complete the installation process.

Processes

sD3.4	Schedule Installation
-------	-----------------------

Experiences

HE.0008	ATP logic/calculation
---------	-----------------------

HE.0083	Enterprise Resource Planning (ERP)
---------	------------------------------------

HE.0204	Production Planning/Scheduling
---------	--------------------------------

Trainings

HT.0068	IFRS/US GAAP revenue recognition
---------	----------------------------------

Practices

BP.020	Demand Management
--------	-------------------

The process to use computer technology to aid in the design, analysis, and manufacture of products.

Processes

sM3.1	Finalize Production Engineering
-------	---------------------------------

Experiences

HE.0012	Bills of Material/Specs/Fabrication Methodology
---------	---

The process of determining and managing the production capacity needed by an organization to meet changing demands for its products.

Processes	
sP5.2	Identify, Assess and Aggregate Return Resources
sE7	Manage Supply Chain Network
Experiences	
HE.0018	Capacity planning
HE.0083	Enterprise Resource Planning (ERP)
HE.0104	Forecasting
HE.0133	Inventory Valuation/Financial Analysis
HE.0159	Master Data/Document Management
HE.0163	Modeling Techniques
HE.0165	MS Office (Excel, Powerpoint, Word, Access)
HE.0230	Sales and Operations Planning (S&OP)
HE.0236	Selecting & Scheduling Modes of Transportation
HE.0247	Spreadsheet Management
HE.0284	Transportation Management - Mode Capabilities/Capacities/Lead Times
HE.0293	Transportation/Warehouse Management systems (TMS/WMS)
Aptitudes	
HA.0001	Accountable
HA.0004	Analytical
HA.0014	Computer Literate
HA.0030	Facilitation ability
HA.0039	Leadership
Trainings	
HT.0006	APICS CPIM
HT.0012	Basic legal process (embargo, black list)
HT.0014	Basic Supply Chain Finance
HT.0021	Capacity Management (Aggregate Planning)
HT.0023	Cellular Manufacturing
HT.0035	Credit Management
HT.0149	Techniques of Detailed Capacity Planning Process

Practices

BP.016	Supply Network Planning
BP.019	Demand Planning
BP.020	Demand Management
BP.021	Sales and Operations Planning

Selection of a transportation mode and service provider in order to meet due dates, cost and service objectives

Processes	
sD1.5	Build Loads
sD2.5	Build Loads
sD3.5	Build Loads
Experiences	
HE.0141	Knowledge of the company's product/services to offer best fit to the customer's requirements/packaging configurations
HE.0180	Packaging Configuration and Palletizing
HE.0284	Transportation Management - Mode Capabilities/Capacities/Lead Times
Aptitudes	
HA.0026	Diversity Recognition/Respect
HA.0072	Written/Verbal Communication
Trainings	
HT.0006	APICS CPIM
HT.0052	ERP Systems Training
HT.0130	Shop Floor-system specific

Working knowledge of the procurement process and the ability to clearly disseminate specific contractual or technical requirements which have changed to Sourced contractors, suppliers or vendors.

Processes	
sS1.5	Authorize Supplier Payment
sS3.3	Schedule Product Deliveries
Experiences	
HE.0005	Advanced Procurement
HE.0011	Basic Procurement
Aptitudes	
HA.0011	Collaborative
Trainings	
HT.0069	Import/Export Regulations
Practices	
BP.169	Beyond Economic Repair (BER) Management

Working knowledge of procurement process for requesting and receiving bids/quotes from competing contractors, suppliers, or vendors based on product part numbers, scope, specifications, terms and conditions and in some cases, the criteria by which the bids will be evaluated.

Processes	
sS2.2	Receive Product

Experiences	
HE.0005	Advanced Procurement

Practices	
BP.132	Issue Invitation to Tender (Quote)
BP.134	Supplier Evaluation using Robust Evaluation Tool.

Working knowledge of Consignment Agreements which are when one party provides goods/services to another party for sale by that other party. The initial party only gets paid when the other party completes the sale of the goods/services.

Processes	
sS2.1	Schedule Product Deliveries
sS3.3	Schedule Product Deliveries
sE6	Manage Supply Chain Contracts

Experiences	
HE.0035	Consignment practices

Practices	
BP.017	Distribution Planning
BP.164	Consignment Inventory Management

Experience in solicitation process, bid/proposal evaluation, contract award and post award administration, and closeout. Such knowledge for setting up such agreements is required throughout the Source functions.

Processes	
sS1.5	Authorize Supplier Payment
sS2.1	Schedule Product Deliveries
sS2.5	Authorize Supplier Payment
sS3.1	Identify Sources of Supply
sS3.2	Select Final Supplier and Negotiate
sS3.3	Schedule Product Deliveries
sS3.7	Authorize Supplier Payment
sD3.2	Negotiate and Receive Contract
sE4	Manage Supply Chain Human Resources
sE5	Manage Supply Chain Assets
sE6	Manage Supply Chain Contracts

Experiences	
HE.0005	Advanced Procurement
HE.0008	ATP logic/calculation
HE.0010	Basic Finance
HE.0011	Basic Procurement
HE.0014	Business model and sales channel
HE.0028	Collaborative Planning, Forecasting and Replenishment (CPFR)
HE.0030	Company Pricing/Margin Policy
HE.0031	Company terms and conditions
HE.0033	Configuration Management
HE.0041	Contractual Terms & Conditions
HE.0081	Engineering/Design Management
HE.0083	Enterprise Resource Planning (ERP)
HE.0093	Establishing Technical/Contracts Team
HE.0141	Knowledge of the company's product/services to offer best fit to the customer's requirements/packaging configurations
HE.0146	Legal Impact
HE.0153	Managing and Measuring Performance
HE.0167	Negotiation
HE.0177	Order-to-cash process

HE.0188	PLM/PDM knowledge
HE.0205	Project Management
HE.0208	Quality Management Systems

Aptitudes

HA.0001	Accountable
HA.0002	Accurate
HA.0007	Business Knowledge & Acumen (Company specific)
HA.0008	Business minded
HA.0014	Computer Literate
HA.0015	Conflict Resolution Skills
HA.0019	Customer Oriented
HA.0023	Diagnostic Information Gathering, Analysis & Problem Solving
HA.0026	Diversity Recognition/Respect
HA.0028	Enabling Technology
HA.0038	Initiative
HA.0046	Numeracy
HA.0056	Process Orientation, Systemic and Conceptual Thinking
HA.0059	Rules Driven
HA.0065	Teamwork & Collaboration
HA.0070	Validation
HA.0072	Written/Verbal Communication

Trainings

HT.0028	Contract Management
HT.0030	Contracting for Supply Professionals
HT.0038	CTL
HT.0051	Equipment & Machine usage certification (trucks & lifting equipment)
HT.0114	Quality Management Systems
HT.0123	Safety and Environmental Management (industry specific, company specific and country specific)
HT.0145	Supply Chain Security

Practices

BP.132	Issue Invitation to Tender (Quote)
BP.134	Supplier Evaluation using Robust Evaluation Tool.
BP.164	Consignment Inventory Management
BP.170	Engineer to Order Production
BP.171	Mixed Mode/Reverse Material Issue

Awareness of relevant regulations, laws and requirements, whether external or internal, and the ability to devise, implement and document the relevant and necessary controls in order to maintain compliance and successfully pass auditing requirements.

Processes	
sS3.2	Select Final Supplier and Negotiate
sS3.3	Schedule Product Deliveries
sE1.1	Gather Business Rule Requirements
sE1.2	Interpret Business Rule Requirement
sE1.3	Document Business Rule
sE8	Manage Regulatory Compliance

Experiences	
HE.0011	Basic Procurement

Aptitudes	
HA.0013	Compliance Orientation

Practices	
BP.147	Receiving Goods Inspection
BP.164	Consignment Inventory Management

Basic financial understanding of analyzing the costs/prices associated with a bid/proposal/quotation for a sourced product for the purpose of attaining best cost/price and/or best value for that product. Also used to determine general understanding of the requirements by the supplier(s) and price reasonableness.

Processes	
sS1.5	Authorize Supplier Payment
sS3.3	Schedule Product Deliveries
Experiences	
HE.0010	Basic Finance
HE.0042	Cost Analysis
Trainings	
HT.0069	Import/Export Regulations
HT.0155	Warehouse Management
Practices	
BP.013	Item Rationalization
BP.088	360 Degree Closure
BP.131	Alternative Supplier Benchmarking
BP.132	Issue Invitation to Tender (Quote)
BP.134	Supplier Evaluation using Robust Evaluation Tool.
BP.169	Beyond Economic Repair (BER) Management

A documented set of basic principles and associated guidelines, formulated and enforced by the governing body or an assigned committee of an organization that direct and limit a company's decisions and actions in pursuit of its objectives.

Processes	
sE1	Manage Supply Chain Business Rules
sE1.1	Gather Business Rule Requirements
sE1.2	Interpret Business Rule Requirement
sE1.3	Document Business Rule
sE8	Manage Regulatory Compliance
Experiences	
HE.0050	Creating/Reviewing/Updating Company Policies
HE.0079	Enforcing Company Policies
HE.0123	Industry Specific Regulatory Knowledge
HE.0205	Project Management
HE.0216	Regulatory Policies/Compliance
HE.0268	Supply Chain Management
Aptitudes	
HA.0001	Accountable
HA.0007	Business Knowledge & Acumen (Company specific)
HA.0009	Business Performance Management
HA.0013	Compliance Orientation
HA.0023	Diagnostic Information Gathering, Analysis & Problem Solving
HA.0028	Enabling Technology
HA.0038	Initiative
HA.0056	Process Orientation, Systemic and Conceptual Thinking
HA.0058	Results & Quality Orientation
HA.0065	Teamwork & Collaboration
HA.0072	Written/Verbal Communication
Practices	
BP.166	Document Management System

Set of activities to assess and rate the credit risk of a customer (ability to meet their financial obligations), identify/block non-creditworthy customers, manage outstanding balances, process credits, and investigate/pursue overdues.

Processes	
sD1.2	Receive, Enter, and Validate Order
sD1.15	Invoice
sD2.2	Receive, Configure, Enter and Validate Order
sD2.15	Invoice
sD3.15	Invoice
sSR3.3	Request Excess Product Return Authorization
sDR3.1	Authorize Excess Product Return
Experiences	
HE.0003	Accounts Receivable
HE.0024	Cash Application
HE.0029	Collections
HE.0051	Credit Management
HE.0073	Dispute Management
HE.0117	Import/Export Regulations
HE.0167	Negotiation
HE.0177	Order-to-cash process
HE.0181	Payment methods
HE.0216	Regulatory Policies/Compliance
Aptitudes	
HA.0002	Accurate
HA.0014	Computer Literate
HA.0019	Customer Oriented
HA.0057	Reliable
HA.0072	Written/Verbal Communication
Trainings	
HT.0006	APICS CPIM
HT.0046	Engineering
HT.0052	ERP Systems Training
HT.0123	Safety and Environmental Management (industry specific, company specific and country specific)

Basic knowledge of linking, staging and moving received sourced products with/to existing open orders minimizing the need for product inventory or storage.

Processes	
sS1.2	Receive Product
sS2.2	Receive Product
sS3.4	Receive Product

Experiences	
HE.0054	Cross Docking

Aptitudes	
HA.0014	Computer Literate

Trainings	
HT.0080	ISO Certification
HT.0098	MRP Systems training

The process or the work flow associated with the identification, receipt, acceptance, picking, packing, delivery and of the packed item(s) to a shipping carrier.

Processes	
sD1.2	Receive, Enter, and Validate Order
sD1.11	Load Vehicle and Generate Shipping Documents
sD2.2	Receive, Configure, Enter and Validate Order
sD2.11	Load Product & Generate Shipping Docs
sD3.11	Load Product & Generate Shipping Docs
Experiences	
HE.0031	Company terms and conditions
HE.0053	CRM Methods and Tools
HE.0078	Electronic Data Interchange (EDI) Systems
HE.0131	Inventory Management
Aptitudes	
HA.0002	Accurate
HA.0008	Business minded
HA.0014	Computer Literate
HA.0019	Customer Oriented
HA.0026	Diversity Recognition/Respect

BP.167	Electronic Returns Tracking
BP.168	Rotable Spares Pool

Delivery balancing is one part of Master Scheduling and involves the balancing of deliveries from suppliers against constrained criteria. These criteria may be opening hours, FLT capacity, docking facilities etc. The process involves negotiation with suppliers as well as capacity planning internally.

Processes	
sS1.1	Schedule Product Deliveries
sS2.1	Schedule Product Deliveries
sS3.3	Schedule Product Deliveries

Experiences	
HE.0039	Contract Administration/Management
HE.0305	Warehouse/Distribution Management

Aptitudes	
HA.0019	Customer Oriented

Practices	
BP.017	Distribution Planning

Basic knowledge of scheduling and managing sourced product deliveries in order to meet the requirements of inventory replenishment or scheduled production plans.

Processes	
sS2.5	Authorize Supplier Payment
sS3.2	Select Final Supplier and Negotiate
sS3.3	Schedule Product Deliveries
sS3.7	Authorize Supplier Payment
Experiences

BP.090	Days of Supply Based MRP Proposal Management
BP.092	Balance and firm within horizon
BP.145	Vendor Collaboration
BP.168	Rotable Spares Pool
BP.091	Work Center Load Evaluation

Analyzing the constraints and requirements of a product design cycle in order to evaluate and ensure the timely availability of the product design for building and installation of a product.

Processes

sD3.4	Schedule Installation
sE5.1	Schedule Asset Management Activities

Experiences

HE.0033	Configuration Management
HE.0080	Engineering Capacity Management
HE.0081	Engineering/Design Management

Aptitudes

HA.0002	Accurate
HA.0014	Computer Literate
HA.0019	Customer Oriented

Ownership of the official, valid (not expired) document stating that the person is authorized and able to drive (a) class/es of vehicles.

Processes	
sD1.12	Ship Product
sD2.12	Ship Product
sD3.12	Ship Product
Experiences	
HE.0061	Customer Stocking Agreements Management
HE.0122	Industry Specific Knowledge and Experience
HE.0211	Reading Maps/Using Navigator
Aptitudes	
HA.0024	Diligent
HA.0066	Technology oriented
HA.0069	Trustworthy and Conscientious
Trainings	
HT.0002	Advanced Excel Techniques
HT.0006	APICS CPIM
HT.0017	Business model and sales channel
HT.0145	Supply Chain Security

The actions, tasks, and responsibilities concerned with the observance and application of the environment, health, and safety rules and standards.

Processes	
sD4.7	Deliver and/or install
sE1.3	Document Business Rule
sE4	Manage Supply Chain Human Resources
sE8	Manage Regulatory Compliance

Experiences	
HE.0084	Environmental, Health and Safety Systems

Aptitudes	
HA.0022	Detail Oriented
HA.0072	Written/Verbal Communication

Trainings	
HT.0050	Environmental regulation

Working awareness of relevant technology that could/can be used to improve the effectiveness or efficiency of operations within Source, but also widely across the Supply Chain or the enterprise. Must be able to deploy with appropriate financial justification using project and change management support.

Processes	
sS3.1	Identify Sources of Supply
sS3.2	Select Final Supplier and Negotiate
Experiences	
HE.0009	Bar Coding/RFID
HE.0083	Enterprise Resource Planning (ERP)
HE.0160	Material Resource Planning (MRP)
Aptitudes	
HA.0014	Computer Literate
Trainings	
HT.0002	Advanced Excel Techniques
HT.0006	APICS CPIM
HT.0017	Business model and sales channel
HT.0027	Conflict Resolution

The discipline, art and profession of acquiring and applying technical, scientific, and mathematical knowledge to design and implement materials, structures, machines, devices, systems, and processes that safely realize a desired objective or invention

Processes	
sS3.1	Identify Sources of Supply
sM1.3	Produce and Test
sM2.3	Produce and Test
sM3.4	Produce and Test
sD1.14	Install Product
sD2.14	Install Product
sD3.3	Enter Order, Commit Resources & Launch Program
sD3.14	Install Product
sE5	Manage Supply Chain Assets
sE5.1	Schedule Asset Management Activities
sE5.2	Take Asset Off-line
sE5.3	Inspect and Troubleshoot
sE5.4	Install and Configure
sE5.5	Clean, Maintain and Repair
sE5.6	Decommission and Dispose
sE5.7	Inspect Maintenance
sE5.8	Reinstate Asset
Experiences	
HE.0033	Configuration Management
HE.0081	Engineering/Design Management
HE.0084	Environmental, Health and Safety Systems
HE.0089	Establishing Engineering and Product Design
HE.0141	Knowledge of the company's product/services to offer best fit to the customer's requirements/packaging configurations
HE.0216	Regulatory Policies/Compliance
HE.0235	Security and compliance
HE.0249	Standards and testing
HE.0274	Technical Collaboration
HE.0275	Technical Data Understanding
HE.0311	Written/Verbal Communication

Aptitudes	
HA.0001	Accountable
HA.0002	Accurate
HA.0014	Computer Literate
HA.0057	Reliable
Trainings	
HT.0006	APICS CPIM
HT.0014	Basic Supply Chain Finance
HT.0102	Negotiation Skills
HT.0122	S&OP training (Oliver Wight, Tom Wallace or equivalent)
HT.0127	SCOR-S/SCOR-P Certification
HT.0136	Statistics
HT.0142	Supply Chain Management
HT.0145	Supply Chain Security

The end-to-end (cross-departmental, and often, cross-company) coordination of work activities that create and deliver ultimate value to customers

Processes	
sP2.1	Identify, Prioritize and Aggregate Product Requirements
sE7	Manage Supply Chain Network
Experiences	
HE.0069	Demand Management
HE.0083	Enterprise Resource Planning (ERP)
HE.0104	Forecasting
HE.0268	Supply Chain Management
Aptitudes	
HA.0045	Negotiator
Trainings	
HT.0002	Advanced Excel Techniques
HT.0006	APICS CPIM
HT.0007	APICS CSCP
Practices	
BP.024	Supply Chain Optimization (SCO)

Familiarity and understanding of internal and external goals, objectives, rules and laws pertaining to the operation of the Source function within the organization. Must have the ability to manage those requirements on behalf of the organisation to meet strategic goals

Processes	
sS3.1	Identify Sources of Supply
sS3.2	Select Final Supplier and Negotiate
sE1	Manage Supply Chain Business Rules
sE8	Manage Regulatory Compliance
Experiences	
HE.0112	Hazardous Materials Handling
Aptitudes	
HA.0060	Safe working
Trainings	
HT.0060	Forecasting Techniques
HT.0076	Inventory Management
HT.0079	ISM CPSM
HT.0097	Modeling Techniques
Practices	
BP.024	Supply Chain Optimization (SCO)

Working awareness of and conversant with installing and operating appropriate Enterprise Resource Planning (ERP) systems relevant to the organisation concerned. ERP is defined as an integrated computer based system used to manage internal and external resources including tangible assets, financial resources, materials and human resources.

Processes	
sS1.2	Receive Product
sS1.4	Transfer Product
sS2.2	Receive Product
sS2.4	Transfer Product
sS2.5	Authorize Supplier Payment
sS3.4	Receive Product
sS3.6	Transfer Product
sS3.7	Authorize Supplier Payment

HA.0014	Computer Literate
HA.0022	Detail Oriented
HA.0072	Written/Verbal Communication
Trainings	
HT.0006	APICS CPIM
HT.0037	CSCMP

The process of managing requirement and constraints associated with a installation schedule in order to effectively schedule product installation as per customer requirements.

Processes	
sD3.4	Schedule Installation
sE5.1	Schedule Asset Management Activities

Experiences	
HE.0205	Project Management
HE.0237	Service / Installation Management

Aptitudes	
HA.0026	Diversity Recognition/Respect
HA.0072	Written/Verbal Communication

Trainings	
HT.0002	Advanced Excel Techniques
HT.0006	APICS CPIM

Actions, tasks and responsibilities concerned with maintenance and update of info related to the number of units of the company products/platform actually installed and in use around the world.

Processes	
sSR1.5	Return Defective Product
sE3	Manage Data and Information
Experiences	
HE.0131	Inventory Management
Aptitudes	
HA.0019	Customer Oriented
Trainings	
HT.0007	APICS CSCP
Practices	
BP.012	Lot Tracking

Conversant with and effectively manage Proprietary Data and Intellectual property on behalf of the organisation. Proprietary Data is defined as internally generated data that contains technical or other types of information controlled by an organisation to safeguard its competitive edge. Proprietary Data may be protected by copyright, patent or trade secret laws in which case it is called Intellectual Property

Processes	
sS3.1	Identify Sources of Supply
sS3.2	Select Final Supplier and Negotiate
sE1	Manage Supply Chain Business Rules
sE1.3	Document Business Rule
sE6	Manage Supply Chain Contracts
sE8	Manage Regulatory Compliance

Experiences	
HE.0126	Intellectual Property Reporting & Restrictions

Aptitudes	
HA.0059	Rules Driven

Trainings	
HT.0060	Forecasting Techniques
HT.0076	Inventory Management

The exchange of capital, goods, and services across international borders or territories

Processes

sE1.3 Document Business Rule

sE6 Manage Supply Chain Contracts

Experiences

HE.0129 International business

Trainings

HT.0062 Fundamentals of International Trade

Basic working knowledge and ability to read, interpret, understand, and effectively communicate (internally and externally) technical specifications and/or drawings to support timely design and delivery of products meeting minimum requirements.

Processes

sS2.1	Schedule Product Deliveries
sS3.3	Schedule Product Deliveries
sE3	Manage Data and Information

Experiences

HE.0278	Technical Specifications
---------	--------------------------

Aptitudes

HA.0072	Written/Verbal Communication
---------	------------------------------

Trainings

HT.0060	Forecasting Techniques
HT.0076	Inventory Management

The formal management of the timing and quantities of goods to be ordered and stocked by an organization in order that demand can always be satisfied without excess expenditure

Processes	
sP1.2	Identify, Prioritize and Aggregate Supply Chain Resources
sP2.1	Identify, Prioritize and Aggregate Product Requirements
sP2.2	Identify, Assess and Aggregate Product Resources
sP2.3	Balance Product Resources with Product Requirements
sP2.4	Establish Sourcing Plans
sP3.1	Identify, Prioritize and Aggregate Production Requirements
sP4.1	Identify, Prioritize and Aggregate Delivery Requirements
sP4.2	Identify, Assess and Aggregate Delivery Resources
sP4.3	Balance Delivery Resources and Capabilities with Delivery Requirements
sP4.4	Establish Delivery Plans
sP5.1	Assess and Aggregate Return Requirements
sP5.2	Identify, Assess and Aggregate Return Resources
sP5.3	Balance Return Resources with Return Requirements

HT.0142	Supply Chain Management
HT.0153	Transportation/Logistics
Practices	
BP.014	Demand Planning & Forecasting
BP.016	Supply Network Planning
BP.024	Supply Chain Optimization (SCO)

Working knowledge of the management and integration of information, sourced product/material, transportation, inventory, warehousing, material-handling, and packaging, and occasionally security, between the point of origin and the point of consumption in order to meet customer requirements.

Processes	
sS1.2	Receive Product
sS2.2	Receive Product
sS3.4	Receive Product
Experiences	
HE.0284	Transportation Management - Mode Capabilities/Capacities/Lead Times
Aptitudes	
HA.0011	Collaborative
Trainings	
HT.0056	Federal/National/International Regulatory Compliance
HT.0080	ISO Certification
HT.0142	Supply Chain Management
Practices	
BP.089	Perfect Pick Put away
BP.115	Transportation Management System

A framework that identifies opportunities for performance improvement through use of performance measures such as standards and indicators.

Processes	
sE2	Manage Performance
sE2.1	Initiate Reporting
sE2.2	Analyze Reports
sE2.3	Find Root Causes
sE2.4	Prioritize Root Causes
sE2.5	Develop Corrective Actions
sE2.6	Approve & Launch
sE4	Manage Supply Chain Human Resources
sE6	Manage Supply Chain Contracts
sE7	Manage Supply Chain Network
sE7.2	Gather Input and Data
Experiences

HE.0172	Operations
Aptitudes	
HA.0007	Business Knowledge & Acumen (Company specific)
HA.0009	Business Performance Management
Trainings	
HT.0032	Cost Reduction Efforts
HT.0073	Introduction to Supply Chain
Practices	
BP.145	Vendor Collaboration

The efficient and effective allocation of an organization's manufacturing resources and assets with the objective of meeting customer demands/requirements.

Processes	
sD3.3	Enter Order, Commit Resources & Launch Program

Experiences	
HE.0083	Enterprise Resource Planning (ERP)
HE.0204	Production Planning/Scheduling

Aptitudes	
HA.0002	Accurate

Practices	
BP.015	Safety Stock Planning
BP.020	Demand Management
BP.091	Work Center Load Evaluation
BP.092	Balance and firm within horizon

Knowledge of co-ordinating and keeping track of all the different components related to the Source activity. Individual activities e.g. deliveries, orders, clearances, contract negotiations etc. will have their own schedules but an overall perspective needs to be maintained both for the Source activity and the smooth operation of the whole Supply Chain

Processes	
sS1.1	Schedule Product Deliveries
sS1.5	Authorize Supplier Payment
sS2.1	Schedule Product Deliveries
sS2.5	Authorize Supplier Payment
sS3.3	Schedule Product Deliveries
sS3.7	Authorize Supplier Payment
Experiences	
HE.0009	Bar Coding/RFID

HT.0127	SCOR-S/SCOR-P Certification
HT.0132	Six Sigma Certification
HT.0142	Supply Chain Management
HT.0153	Transportation/Logistics

Working knowledge of contractual requirements for the authorization of monetary payments for the successful completion of pre-defined development or performance milestones

Processes	
sS3.1	Identify Sources of Supply
sS3.2	Select Final Supplier and Negotiate
sS3.3	Schedule Product Deliveries
Experiences	
HE.0262	Supplier Performance Assessment
Aptitudes	
HA.0014	Computer Literate
HA.0072	Written/Verbal Communication
Trainings	
HT.0056	Federal/National/International Regulatory Compliance
HT.0057	Financial Accounting
HT.0065	Green Procurement
HT.0078	IP, Technology patents and copyrights

The techniques used in material requirements planning systems to develop a detailed plan for product manufacturing. The master production schedule takes account of the requirements of various departments, including sales (delivery dates), finance (inventory minimization), and manufacturing (minimization of setup times) to schedules production and the purchasing of materials within the capacity of and resources available to the production system.

Processes	
sP1.2	Identify, Prioritize and Aggregate Supply Chain Resources
sP3.1	Identify, Prioritize and Aggregate Production Requirements
Experiences	
HE.0012	Bills of Material/Specs/Fabrication Methodology
HE.0019	Capital planning
HE.0083	Enterprise Resource Planning (ERP)
HE.0096	Existing internal metrics and relationships
HE.0142	Lead time management
HE.0150	Make/Buy decision analysis
HE.0160	Material Resource Planning (MRP)
HE.0165	MS Office (Excel, Powerpoint, Word, Access)
HE.0230	Sales and Operations Planning (S&OP)
HE.0247	Spreadsheet Management
Aptitudes	
HA.0004	Analytical
HA.0014	Computer Literate
HA.0018	Cross Functional
HA.0030	Facilitation ability
HA.0039	Leadership
HA.0052	Presentor
HA.0065	Teamwork & Collaboration
HA.0072	Written/Verbal Communication
Trainings	
HT.0028	Contract Management
HT.0057	Financial Accounting
HT.0064	General Procurement & Subcontracting
HT.0080	ISO Certification
HT.0108	Procurement/Subcontracting On Job Training
HT.0127	SCOR-S/SCOR-P Certification

Practices

BP.022

MRP I

All actions which have the objective of retaining or restoring an item in or to a state in which it can perform its required function. The actions include the combination of all technical and corresponding administrative, managerial, and supervision actions

Experiences

HE.0164	MRO management
---------	----------------

Practices

BP.168	Rotable Spares Pool
--------	---------------------

BP.169	Beyond Economic Repair (BER) Management
--------	---

The process of ensuring materials and products are available for production and delivery to customers, maintaining the lowest possible level of inventory and planning manufacturing activities, delivery schedules and purchasing activities.

Processes	
sS1.4	Transfer Product
sM1.4	Package
sM3.2	Schedule Production Activities
sM3.3	Issue Sourced/In-Process Product
Experiences	
HE.0016	Business plans
HE.0036	Construction reasoning
HE.0075	DOT/EPA
HE.0104	Forecasting
HE.0158	Master build plan
HE.0160	Material Resource Planning (MRP)
HE.0203	Production build process
Trainings	
HT.0001	Advanced Accounting principles
HT.0010	Basic and Advanced Finance
HT.0028	Contract Management
HT.0046	Engineering
HT.0094	Material Planning Process
HT.0116	Regulatory Compliance
Practices	
BP.015	Safety Stock Planning
BP.019	Demand Planning
BP.020	Demand Management
BP.088	360 Degree Closure
BP.090	Days of Supply Based MRP Proposal Management
BP.092	Balance and firm within horizon

Working knowledge and understanding of strict regulatory adherence to health and environmental requirements/restrictions associated with particular products as detailed on Material Safety Data Sheets (MSDS) or Certificates of Compliance CoC), throughout product ordering, receipt, storage, stage, transport and final delivery.

Processes	
sS1.1	Schedule Product Deliveries
sS1.2	Receive Product
sS1.3	Verify Product
sS1.4	Transfer Product
sS2.1	Schedule Product Deliveries
sS2.2	Receive Product
sS2.4	Transfer Product
sS3.3	Schedule Product Deliveries
sS3.4	Receive Product
sS3.5	Verify Product
sS3.6	Transfer Product
Experiences	
HE.0112	Hazardous Materials Handling
HE.0227	Safety Requirements
Aptitudes	
HA.0060	Safe working
HA.0061	Situational Awareness
Trainings	
HT.0028	Contract Management
HT.0064	General Procurement & Subcontracting
HT.0087	Legal Rules
HT.0108	Procurement/Subcontracting On Job Training
HT.0132	Six Sigma Certification

Familiarity with relevant Office Automation Tools and be able to deploy against financial justification as appropriate taking account of project and change management requirements. Office Automation Tools are defined as all tools and methods that can be applied to office activities which make it possible to improve effectiveness or efficiency of those activities.

Processes	
sS1.3	Verify Product
sS3.5	Verify Product
sE3	Manage Data and Information
Experiences	
HE.0165	MS Office (Excel, Powerpoint, Word, Access)
Aptitudes	
HA.0014	Computer Literate
Trainings	
HT.0108	Procurement/Subcontracting On Job Training
HT.0132	Six Sigma Certification

The process of improving various aspects of the business resulting in (such as) increased profits, improved product or greater customer satisfaction.

Processes	
sM1.1	Schedule Production Activities
sM2.1	Schedule Production Activities
sE2	Manage Performance
sE7	Manage Supply Chain Network
sE7.3	Develop Scenarios
sE7.4	Model/Simulate Scenarios
Experiences	
HE.0018	Capacity planning
HE.0046	Cost/Benefit Analysis
HE.0083	Enterprise Resource Planning (ERP)
HE.0119	Industrial engineering
HE.0122	Industry Specific Knowledge and Experience
HE.0174	Optimization software
HE.0233	SCOR
HE.0268	Supply Chain Management
Aptitudes	
HA.0007	Business Knowledge & Acumen (Company specific)
HA.0023	Diagnostic Information Gathering, Analysis & Problem Solving
HA.0028	Enabling Technology
Trainings	
HT.0048	Enterprise Optimization
HT.0060	Forecasting Techniques
HT.0065	Green Procurement

HT.0116	Regulatory Compliance
HT.0149	Techniques of Detailed Capacity Planning Process
Practices	
BP.015	Safety Stock Planning
BP.020	Demand Management
BP.024	Supply Chain Optimization (SCO)

The process or the work flow associated with the identification, receipt, acceptance, picking, packing, delivery and of the packed item(s) to a shipping carrier.

Processes	
sS1.1	Schedule Product Deliveries
sS2.1	Schedule Product Deliveries
sS2.2	Receive Product
sS3.3	Schedule Product Deliveries
sD1.3	Reserve Inventory and Determine Delivery Date
sD1.4	Consolidate Orders
sD2.3	Reserve Inventory and Determine Delivery Date
sD2.4	Consolidate Orders
sD3.3	Enter Order, Commit Resources & Launch Program
sDR2.1	Authorize MRO Product Return
sDR2.2	Schedule MRO Return Receipt
sDR2.3	Receive MRO Product
sDR2.4	Transfer MRO Product
Experiences	
HE.0031	Company terms and conditions
HE.0053	CRM Methods and Tools
HE.0078	Electronic Data Interchange (EDI) Systems
HE.0083	Enterprise Resource Planning (ERP)
HE.0098	Fast track, partial delivery

HE.0238	Service level calculation tools and metrics
HE.0270	Supply chain planning
HE.0284	Transportation Management - Mode Capabilities/Capacities/Lead Times
HE.0289	Transportation Scheduling
Aptitudes	
HA.0002	Accurate
HA.0008	Business minded
HA.0014	Computer Literate

HA.0019	Customer Oriented
HA.0026	Diversity Recognition/Respect
HA.0071	Work Control
HA.0072	Written/Verbal Communication

Trainings

HT.0003	Advanced Negotiations/Collaborative Planning
HT.0025	Communicating Customer & Supplier Information
HT.0033	Cost/Price Analysis
HT.0047	Enterprise & Material Resource Planning Systems
HT.0049	Enterprise Strategic Business Rules
HT.0056	Federal/National/International Regulatory Compliance
HT.0084	Lean Manufacturing Training
HT.0108	Procurement/Subcontracting On Job Training
HT.0112	Project Management
HT.0127	SCOR-S/SCOR-P Certification
HT.0128	SCORmark

Practices

BP.088	360 Degree Closure
BP.089	Perfect Pick Put away
BP.090	Days of Supply Based MRP Proposal Management
BP.114	Order Quotation System
BP.115	Transportation Management System
BP.144	Purchase Order Management
BP.145	Vendor Collaboration
BP.168	Rotable Spares Pool

A company that contracts with another company to provide services that might otherwise be performed by in-house employees

Processes	
sE4	Manage Supply Chain Human Resources
sE5	Manage Supply Chain Assets
sE6	Manage Supply Chain Contracts
sE7	Manage Supply Chain Network
sE7.3	Develop Scenarios

Experiences	
HE.0179	Outsourcing
HE.0258	Supplier Certification

Trainings	
HT.0105	Outsourcing

Practices	
BP.013	Item Rationalization

The processes of coordinating a system of preparing goods for transport, warehousing, logistics, sale, and end use. This process includes any written, electronic, or graphic communications on the packaging or on a separate but associated label.

Processes	
sS1.4	Transfer Product
sS2.4	Transfer Product
sS3.6	Transfer Product
sM1.4	Package
sM2.4	Package
sM3.5	Package
Experiences	
HE.0037	Container optimization
HE.0119	Industrial engineering
HE.0148	Local/national/global transportation guidelines
HE.0180	Packaging Configuration and Palletizing
Aptitudes	
HA.0050	Physical ability
Trainings	
HT.0043	Electronic Data Exchange Systems
HT.0076	Inventory Management
HT.0080	ISO Certification
HT.0104	Occupational Safety & Health
HT.0108	Procurement/Subcontracting On Job Training
HT.0112	Project Management
HT.0114	Quality Management Systems
HT.0120	Risk Management

Working knowledge of the processes and policies required for contractual authorization of payments for sourced products and services. This includes basic financial accounting practices.

Processes	
sS2.1	Schedule Product Deliveries
sS2.5	Authorize Supplier Payment
sS3.7	Authorize Supplier Payment
sD4.6	Checkout
Experiences	
HE.0002	Accounting
HE.0066	Data/Document Management
HE.0083	Enterprise Resource Planning (ERP)
HE.0220	Retail payment management
Aptitudes	
HA.0014	Computer Literate
HA.0022	Detail Oriented
HA.0043	Multitasking
HA.0053	Prioritization
Trainings	
HT.0010	Basic and Advanced Finance
HT.0028	Contract Management
HT.0056	Federal/National/International Regulatory Compliance
HT.0084	Lean Manufacturing Training
HT.0127	SCOR-S/SCOR-P Certification
HT.0139	Subcontracting Management
HT.0142	Supply Chain Management
Practices	
BP.148	3-Way Delivery Verification

The ability to complete a process through the use of dexterity, strength or other capacities.

Processes

sM1.2	Issue Material
sM2.2	Issue Sourced/In-Process Product

Experiences

HE.0105	Forklift or Other Material Handling Equipment Experience
HE.0135	Item crib management

Aptitudes

HA.0050	Physical ability
---------	------------------

Trainings

HT.0043	Electronic Data Exchange Systems
HT.0044	Electronic Identification Systems

The set of activities concerned with efficient movement of finished goods from the end of the production operation to the consumer.

Experiences	
HE.0023	Carrier selection & qualification
HE.0138	Just-In-Time Inventory
HE.0144	Lean Manufacturing
HE.0157	Marketing
HE.0169	Network Optimization
HE.0205	Project Management
HE.0233	SCOR
HE.0297	Utilizing Customer Relationship Management System
Aptitudes	
HA.0001	Accountable
HA.0007	Business Knowledge & Acumen (Company specific)
HA.0010	Change Management
HA.0023	Diagnostic Information Gathering, Analysis & Problem Solving
HA.0028	Enabling Technology
HA.0038	Initiative
HA.0056	Process Orientation, Systemic and Conceptual Thinking
HA.0065	Teamwork & Collaboration
HA.0072	Written/Verbal Communication
Trainings	
HT.0074	Inventory Centralization
HT.0081	Just - In - Time (JIT)
HT.0084	Lean Manufacturing Training
HT.0107	Physical Distribution Systems
HT.0126	SCOR

The process of selecting and collecting SKUs and materials in a specified order and quantity with the objective of satisfying customers orders.

Processes	
sD4.3	Pick Product from backroom
sD4.5	Fill Shopping Cart
Experiences	
HE.0066	Data/Document Management
HE.0131	Inventory Management
HE.0187	Planogram tool usage
Aptitudes	
HA.0014	Computer Literate
HA.0022	Detail Oriented
Trainings	
HT.0091	Managing Hazardous Materials
HT.0106	Packaging and palletizing
HT.0114	Quality Management Systems
HT.0132	Six Sigma Certification
HT.0155	Warehouse Management
Practices	
BP.089	Perfect Pick Put away

The process of using a planogram to diagram fixtures and products to illustrate how and where retail products should be displayed, usually on a store shelf in order to increase customer purchases

Processes	
sP4.1	Identify, Prioritize and Aggregate Delivery Requirements
sD4.1	Generate Stocking Schedule
Experiences	
HE.0131	Inventory Management
HE.0159	Master Data/Document Management
HE.0163	Modeling Techniques
HE.0204	Production Planning/Scheduling
HE.0247	Spreadsheet Management
HE.0253	Stocking plan management
Aptitudes	
HA.0004	Analytical
HA.0014	Computer Literate
Trainings	
HT.0006	APICS CPIM
HT.0084	Lean Manufacturing Training
HT.0114	Quality Management Systems
HT.0127	SCOR-S/SCOR-P Certification

The analysis and setting of prices (on a per unit or volume basis) to meet required characteristics, business rules and/or business performance requirements.

Processes	
sD1.1	Process Inquiry and Quote
sD1.2	Receive, Enter, and Validate Order
sD2.1	Process Inquiry and Quote
sD2.2	Receive, Configure, Enter and Validate Order
Experiences	
HE.0030	Company Pricing/Margin Policy
HE.0141	Knowledge of the company's product/services to offer best fit to the customer's requirements/packaging configurations
HE.0167	Negotiation
HE.0177	Order-to-cash process
Aptitudes	
HA.0002	Accurate
Trainings	
HT.0049	Enterprise Strategic Business Rules
HT.0052	ERP Systems Training
HT.0098	MRP Systems training
Practices	
BP.114	Order Quotation System
BP.132	Issue Invitation to Tender (Quote)
BP.134	Supplier Evaluation using Robust Evaluation Tool.
BP.148	3-Way Delivery Verification

The knowledge and ability to arrange process steps, jobs or orders in queue, or product receipts in the proper sequence in order to meet product/service production and deliveries as scheduled.

Processes	
sS1.1	Schedule Product Deliveries
sS2.1	Schedule Product Deliveries
sS3.3	Schedule Product Deliveries
sE7	Manage Supply Chain Network
Experiences	
HE.0017	Business Rules/Regulatory Policy/Company Return Policy
HE.0190	Point of Use Storage
Aptitudes	
HA.0011	Collaborative
HA.0038	Initiative
Trainings	
HT.0028	Contract Management
HT.0041	Disposition Resolution
HT.0114	Quality Management Systems

Working knowledge of the process for acquiring goods and/or services at the best possible total cost of ownership, in the right quantity, quality, at the right time and in the right place, with all required documentation. This may include simple repetitive Make-to-Stock purchases or more complex Make-to-Order or Engineer-to-Order products.

Processes	
sS1.1	Schedule Product Deliveries
sS2.1	Schedule Product Deliveries
sS3.1	Identify Sources of Supply
sS3.2	Select Final Supplier and Negotiate
sS3.3	Schedule Product Deliveries
sD1.1	Process Inquiry and Quote
sD2.1	Process Inquiry and Quote
sD3.1	Obtain and Respond to RFP/RFQ
sE6	Manage Supply Chain Contracts

Experiences	
HE.0011	Basic Procurement
HE.0017	Business Rules/Regulatory Policy/Company Return Policy
HE.0083	Enterprise Resource Planning (ERP)
HE.0087	Establishing Commercial Requirements
HE.0088	Establishing Effective SOW, Specifications, and Evaluation Criteria
HE.0092	Establishing Source and Evaluation Criteria
HE.0100	Financial Accounting
HE.0109	Funnel update/ management
HE.0210	Quotation/CRM tool
HE.0275	Technical Data Understanding

Aptitudes	
HA.0011	Collaborative
HA.0014	Computer Literate
HA.0046	Numeracy
HA.0059	Rules Driven

Trainings	
HT.0006	APICS CPIM
HT.0015	Blanket Purchase Agreements
HT.0017	Business model and sales channel

HT.0026	Company Policies, Mission and Strategy, Business Conduct
HT.0028	Contract Management
HT.0037	CSCMP
HT.0049	Enterprise Strategic Business Rules
HT.0063	General Accounting
HT.0079	ISM CPSM
HT.0084	Lean Manufacturing Training
HT.0102	Negotiation Skills
HT.0109	Product Specific Training
HT.0127	SCOR-S/SCOR-P Certification
HT.0132	Six Sigma Certification
HT.0142	Supply Chain Management
HT.0145	Supply Chain Security
HT.0153	Transportation/Logistics
Practices	
BP.144	Purchase Order Management
BP.132	Issue Invitation to Tender (Quote)
BP.134	Supplier Evaluation using Robust Evaluation Tool.

The analysis of stated product and configuration specifications against required and feasible product's performance, functional, and physical requirements.

Processes	
sD1.2	Receive, Enter, and Validate Order
sD2.2	Receive, Configure, Enter and Validate Order
sE5.7	Inspect Maintenance
Experiences	
HE.0030	Company Pricing/Margin Policy
HE.0033	Configuration Management
HE.0141	Knowledge of the company's product/services to offer best fit to the customer's requirements/packaging configurations
Trainings	
HT.0026	Company Policies, Mission and Strategy, Business Conduct
HT.0116	Regulatory Compliance
Practices	
BP.114	Order Quotation System
BP.168	Rotable Spares Pool

The process of removing a product from inventory and exchanging funds for the value of the product in a retail supply chain

Processes	
sD4.6	Checkout
Experiences	
HE.0057	Customer Relationship Management (CRM)
HE.0066	Data/Document Management
HE.0131	Inventory Management
HE.0141	Knowledge of the company's product/services to offer best fit to the customer's requirements/packaging configurations
Aptitudes	
HA.0014	Computer Literate
HA.0022	Detail Oriented
Trainings	
HT.0102	Negotiation Skills
HT.0109	Product Specific Training
HT.0116	Regulatory Compliance

Familiarity and awareness of the Product Development process and its key steps and the interaction with the Source activity. Where Product Development activities fall to suppliers ensure a seamless process with the product development specialists whilst managing commercial and logistical demands and expectations. Ensure that risk and reward are controlled throughout the process with suppliers.

Processes	
sS3.1	Identify Sources of Supply

Experiences	
HE.0274	Technical Collaboration

Trainings	
HT.0052	ERP Systems Training

The use of software or other tools to capture and maintain information on products and/or services through their life cycle.

Processes	
sD1.1	Process Inquiry and Quote
sD2.1	Process Inquiry and Quote
sE3	Manage Data and Information
Experiences	
HE.0033	Configuration Management
HE.0141	Knowledge of the company's product/services to offer best fit to the customer's requirements/packaging configurations
HE.0188	PLM/PDM knowledge
Aptitudes	
HA.0014	Computer Literate
Trainings	
HT.0109	Product Specific Training
Practices	
BP.013	Item Rationalization
BP.166	Document Management System

The process of using machines, tools, materials and labor to make things for use or sale.

Processes

sM1.3 Produce and Test

sM2.1 Schedule Production Activities

sM2.3 Produce and Test

sM3.4 Produce and Test

Experiences

HE.0122 Industry Specific Knowledge and Experience

Aptitudes

HA.0050 Physical ability

Trainings

HT.0102 Negotiation Skills

HT.0116 Regulatory Compliance

Practices

BP.088 360 Degree Closure

Actions, tasks and responsibilities concerned with the planning, scheduling and releasing of production orders in order to satisfy demand while optimizing the available and planned resources/ capacity.

Processes	
sSR3.1	Identify Excess Product Condition
Experiences	
HE.0176	Order Processing System/Enterprise Resource Planning Systems Usage (ERP)System
Aptitudes	
HA.0072	Written/Verbal Communication
Trainings	
HT.0020	Capability & Organization Risks
Practices	
BP.020	Demand Management
BP.090	Days of Supply Based MRP Proposal Management
BP.092	Balance and firm within horizon

The process of determining the production capacity, maximum amount of work that an organization is capable of completing in a given period of time, needed by an organization to meet changing demands for its products.

Processes	
sP2.1	Identify, Prioritize and Aggregate Product Requirements
sP2.2	Identify, Assess and Aggregate Product Resources
sP2.3	Balance Product Resources with Product Requirements
sP2.4	Establish Sourcing Plans
sP3.1	Identify, Prioritize and Aggregate Production Requirements
sP3.2	Identify, Assess and Aggregate Production Resources
sP3.3	Balance Production Resources with Production Requirements
sP3.4	Establish Production Plans
Experiences	
HE.0059	Customer Service Strategy Agreements
HE.0083	Enterprise Resource Planning (ERP)
HE.0085	EOQ management
HE.0159	Master Data/Document Management
HE.0160	Material Resource Planning (MRP)
HE.0162	Materials portfolio and specifications
HE.0163	Modeling Techniques
HE.0165	MS Office (Excel, Powerpoint, Word, Access)
HE.0167	Negotiation
HE.0204	Production Planning/Scheduling
HE.0209	Quality processes related to inventory management (test times, shelf life)
HE.0230	Sales and Operations Planning (S&OP)
HE.0247	Spreadsheet Management
HE.0251	Statistical Modeling/Analysis
HE.0263	Supplier production and lead time capabilities
HE.0265	Supplier Service Strategy Agreements
Aptitudes	
HA.0004	Analytical
HA.0014	Computer Literate
HA.0015	Conflict Resolution Skills
HA.0030	Facilitation ability
HA.0039	Leadership
HA.0052	Presentor

HA.0065	Teamwork & Collaboration
HA.0072	Written/Verbal Communication
Trainings	
HT.0006	APICS CPIM

HT.0102	Negotiation Skills
HT.0109	Product Specific Training
HT.0116	Regulatory Compliance
HT.0121	Routing and rating
HT.0145	Supply Chain Security

Manufacturing system in which production is based on a projected production plan and where information flows from management to the market, the same direction in which the materials flow

No Experiences, Aptitudes or Trainings identified.

The organizational structure, procedures, processes and resources needed to implement quality management.

Processes	
sS1.3	Verify Product
sS1.4	Transfer Product
sS2.1	Schedule Product Deliveries
sS2.3	Verify Product
sS2.4	Transfer Product
sS2.5	Authorize Supplier Payment
sS3.1	Identify Sources of Supply
sS3.3	Schedule Product Deliveries
sS3.5	Verify Product
sS3.6	Transfer Product
sS3.7	Authorize Supplier Payment
sM1.6	Release Product to Deliver
sM2.6	Release Finished Product to Deliver
sM3.7	Release Product to Deliver
sD1.13	Receive and verify Product by Customer
sD2.13	Receive and verify Product by Customer
sD3.13	Receive and verify Product by Customer
sD4.2	Receive Product at Store
sSR2.1	Identify MRO Product Condition
sDR2.3	Receive MRO Product
sE2	Manage Performance
sE5.1	Schedule Asset Management Activities
sE5.3	Inspect and Troubleshoot
Experiences	
HE.0017	Business Rules/Regulatory Policy/Company Return Policy
HE.0045	Cost Reduction Efforts
HE.0076	Economic Repair Assessment
HE.0091	Establishing Quality Requirements
HE.0144	Lean Manufacturing
HE.0153	Managing and Measuring Performance
HE.0172	Operations
HE.0201	Product Structure

HE.0208	Quality Management Systems

HT.0053	Evaluating Performance of Production Operations
HT.0054	Evaluating Quality Management Process
HT.0114	Quality Management Systems
HT.0149	Techniques of Detailed Capacity Planning Process
HT.0150	Total Quality Management (TQM)

Practices

BP.012	Lot Tracking
BP.088	360 Degree Closure
BP.147	Receiving Goods Inspection

The process of systemically and physically moving materials from an in-bound supply source to a short or long-term intermediate storage location.

Processes	
sD4.2	Receive Product at Store
sDR2.3	Receive MRO Product
Experiences	
HE.0017	Business Rules/Regulatory Policy/Company Return Policy
HE.0066	Data/Document Management
HE.0131	Inventory Management
HE.0187	Planogram tool usage
HE.0216	Regulatory Policies/Compliance
Aptitudes	
HA.0002	Accurate
HA.0014	Computer Literate
HA.0022	Detail Oriented
Practices	
BP.088	360 Degree Closure
BP.072	Inbound RMA-enabled Processing
BP.073	Returns Receiving Refurbishment
BP.089	Perfect Pick Put away
BP.147	Receiving Goods Inspection

Actions, tasks and responsibilities concerned with a set of quality/legal/administrative/internal rules and standards to be complied with

Processes

sSR1.1	Identify Defective Product Condition
--------	--------------------------------------

sE8	Manage Regulatory Compliance
-----	------------------------------

Experiences

HE.0216	Regulatory Policies/Compliance
---------	--------------------------------

Aptitudes

HA.0002	Accurate
---------	----------

HA.0057	Reliable
---------	----------

Ability to understand, interpret and effectively communicate to contractors, suppliers, or vendors product specifications and/or technical data which clearly delineates specific requirements regarding product acceptance.

Processes	
sS1.3	Verify Product
sS2.3	Verify Product
sS3.5	Verify Product

Experiences	
HE.0208	Quality Management Systems

Practices	
BP.147	Receiving Goods Inspection

Manage the allocation of defined specifications to materials and services being procured. Defined specifications will be straightforward. Generic specifications will require a level of understanding and liaison if need be with Technical personnel.

Processes	
sS1.3	Verify Product
sS3.5	Verify Product
Experiences	
HE.0012	Bills of Material/Specs/Fabrication Methodology
Aptitudes	
HA.0067	Thinking & Problem Solving

Manage a system that ensures up to date specifications are available when required and that an audit trail back to suppliers and internal Quality exists.

Processes

sS1.3 Verify Product

sS3.5 Verify Product

Experiences

HE.0027 Change management system

Aptitudes

HA.0072 Written/Verbal Communication

Practices

BP.166 Document Management System

Ability to manage all aspects of Requirements Criteria, Verification Methods and Tools.
 Requirements criteria is a statement of needs, rules, standards or tests that must be used in evaluating a decision, idea, opportunity, programme, project etc. to form a correct judgement regarding the intended goal.

Processes	
sS1.3	Verify Product
sS2.3	Verify Product
sS3.5	Verify Product
Experiences	
HE.0183	Performance Reporting Systems Development/Use
HE.0208	Quality Management Systems
HE.0218	Requirements verification methods & tools
Aptitudes	
HA.0042	Methodic
Practices	
BP.166	Document Management System

To understand the importance of Requirements Defect Notification and to manage a system to monitor, analyse, highlight, and then notify for action, defects arising. Trend and pattern analysis is important as well as the correct flow of information to, and relationships with, suppliers.

Processes	
sS1.3	Verify Product
sS3.5	Verify Product
Experiences	
HE.0208	Quality Management Systems
Aptitudes	
HA.0072	Written/Verbal Communication
Practices	
BP.147	Receiving Goods Inspection
BP.166	Document Management System

Ability to assemble and then present internally and externally the Requirements Justification/ Rationale required for your organisation concerning for example the quality requirements for a vital component/material supplied by a third party. Effective justifications/rationale will be linked to internal as well as external requirements and fulfil short, medium and longer term needs.

Processes	
sS1.3	Verify Product
sS2.3	Verify Product
sS3.5	Verify Product

Experiences	
HE.0208	Quality Management Systems

Aptitudes	
HA.0019	Customer Oriented

Practices	
BP.166	Document Management System

Ability to demonstrate familiarity in the use of Requirements Syntax, Attributes & Baselines. For example attributes to be considered would include:- feasible, traceable one level higher, complete, testable, unambiguous etc.

Processes	
sS1.3	Verify Product
sS2.3	Verify Product
sS3.5	Verify Product

Experiences	
HE.0279	Technical writing of requirements deliverables

Practices	
BP.166	Document Management System

Ability to execute the process of identifying and handling products or material which require return or disposal, regardless if it is a return for warranty repairs, damaged or defective goods (including expired shelf life), or maintenance, repair and overhaul (MRO). This process requires to be executed with strict compliance with all contractual terms and conditions, regulatory, and environmental (and green) restrictions.

Processes	
sS1.2	Receive Product
sS1.3	Verify Product
sS1.4	Transfer Product
sS2.2	Receive Product
sS2.4	Transfer Product
sS3.4	Receive Product
sS3.5	Verify Product
sS3.6	Transfer Product
Experiences	
HE.0146	Legal Impact
HE.0221	Return Process
HE.0257	Supplier & shipping agreements
Aptitudes	
HA.0035	Good Judgment Execution
Practices	
BP.073	Returns Receiving Refurbishment
BP.072	Inbound RMA-enabled Processing
BP.025	Self-Service Warranty Claim Submittal
BP.140	Return Authorization Required
BP.141	Proactive Return Authorization
BP.142	Remote Return Authorization
BP.147	Receiving Goods Inspection
BP.167	Electronic Returns Tracking
BP.168	Rotable Spares Pool

The process of developing, analyzing, and maintaining an organizational return plan.

Processes	
sP5.4	Establish and Communicate Return Plans
Experiences	
HE.0083	Enterprise Resource Planning (ERP)
HE.0159	Master Data/Document Management
HE.0165	MS Office (Excel, Powerpoint, Word, Access)
HE.0247	Spreadsheet Management
HE.0293	Transportation/Warehouse Management systems (TMS/WMS)
Aptitudes	
HA.0014	Computer Literate
Practices	
BP.167	Electronic Returns Tracking

A system for managing the returns of faulty products.

Processes	
sP5.3	Balance Return Resources with Return Requirements
Experiences	
HE.0001	ABC Accounting
HE.0083	Enterprise Resource Planning (ERP)
HE.0104	Forecasting
HE.0152	Management of service Strategy agreements with customers
HE.0159	Master Data/Document Management
HE.0163	Modeling Techniques
HE.0165	MS Office (Excel, Powerpoint, Word, Access)
HE.0230	Sales and Operations Planning (S&OP)
HE.0247	Spreadsheet Management
HE.0284	Transportation Management - Mode Capabilities/Capacities/Lead Times
HE.0293	Transportation/Warehouse Management systems (TMS/WMS)
Aptitudes	
HA.0004	Analytical
HA.0014	Computer Literate
HA.0030	Facilitation ability
HA.0039	Leadership
HA.0067	Thinking & Problem Solving

End-to-end activities, responsibilities and tasks to accept, operationally process and successfully close the returns of products/materials because of unwanted product, defect, repair, refurbishing, recycling.

Processes	
sSR2.2	Disposition MRO Product
sSR2.3	Request MRO Return Authorization
sSR2.4	Schedule MRO Shipment
sSR2.5	Return MRO Product
sDR2.1	Authorize MRO Product Return
Experiences	
HE.0002	Accounting
HE.0076	Economic Repair Assessment
HE.0221	Return Process
HE.0264	Supplier Relationship Management (SRM)
HE.0268	Supply Chain Management
HE.0284	Transportation Management - Mode Capabilities/Capacities/Lead Times
Aptitudes	
HA.0002	Accurate
HA.0072	Written/Verbal Communication
Practices	
BP.141	Proactive Return Authorization
BP.025	Self-Service Warranty Claim Submittal
BP.136	Outsourced Reverse Logistics
BP.140	Return Authorization Required
BP.142	Remote Return Authorization
BP.167	Electronic Returns Tracking
BP.168	Rotable Spares Pool
BP.169	Beyond Economic Repair (BER) Management

The process by which specification and pricing proposals are evaluated, rated and accepted/rejectedd based upon criteria and objectives of the overall sourcing process.

Processes	
sD3.1	Obtain and Respond to RFP/RFQ
Experiences	
HE.0008	ATP logic/calculation
HE.0014	Business model and sales channel
HE.0030	Company Pricing/Margin Policy
HE.0031	Company terms and conditions
HE.0033	Configuration Management
HE.0053	CRM Methods and Tools
HE.0081	Engineering/Design Management
HE.0083	Enterprise Resource Planning (ERP)
HE.0141	Knowledge of the company's product/services to offer best fit to the customer's requirements/packaging configurations
HE.0167	Negotiation
HE.0177	Order-to-cash process
HE.0188	PLM/PDM knowledge
Aptitudes	
HA.0002	Accurate
HA.0008	Business minded
HA.0014	Computer Literate
HA.0019	Customer Oriented
HA.0026	Diversity Recognition/Respect
HA.0072	Written/Verbal Communication

The identification, assessment, and prioritization of risks and exceptions followed by coordinated and economical application of resources to minimize, monitor, and control the probability and/or impact of unfortunate events

Processes	
sP2.1	Identify, Prioritize and Aggregate Product Requirements
sP2.2	Identify, Assess and Aggregate Product Resources
sP2.3	Balance Product Resources with Product Requirements
sP2.4	Establish Sourcing Plans
sE9	Manage Supply Chain Risk
sE9.1	Establish Context
Experiences	
HE.0083	Enterprise Resource Planning (ERP)
HE.0120	Industry Analysis of Supply Markets
HE.0159	Master Data/Document Management
HE.0162	Materials portfolio and specifications
HE.0167	Negotiation
HE.0204	Production Planning/Scheduling
HE.0209	Quality processes related to inventory management (test times, shelf life)
HE.0230	Sales and Operations Planning (S&OP)
HE.0247	Spreadsheet Management
HE.0263	Supplier production and lead time capabilities
HE.0265	Supplier Service Strategy Agreements
HE.0269	Supply Chain Performance Management/Metrics
HE.0270	Supply chain planning
Aptitudes	
HA.0001	Accountable
HA.0004	Analytical
HA.0009	Business Performance Management
HA.0014	Computer Literate
HA.0028	Enabling Technology
HA.0030	Facilitation ability
HA.0038	Initiative
HA.0039	Leadership
HA.0052	Presentor
HA.0062	Strategic Leadership & Ensuring Business Alignment

HE.0288	Transportation Regulations
HE.0293	Transportation/Warehouse Management systems (TMS/WMS)
Aptitudes	
HA.0014	Computer Literate
HA.0054	Problem Solving
HA.0068	Time Management

The process of reviewing and communicating the output and changes in the Sales and Operations Plan.

Processes	
sP1.4	Establish and Communicate Supply Chain Plans
Experiences	
HE.0230	Sales and Operations Planning (S&OP)
Aptitudes	
HA.0015	Conflict Resolution Skills
HA.0018	Cross Functional
HA.0034	Goal Oriented
HA.0065	Teamwork & Collaboration
Practices	
BP.007	Baseline Inventory Monitoring
BP.008	Slow-moving Inventory Monitoring
BP.020	Demand Management
BP.021	Sales and Operations Planning

The calculation of appropriate stocking levels to mitigate demand variability through the inclusion of all relevant lead times, variability during lead times, and desired service levels.

Processes	
sD4.1	Generate Stocking Schedule
sD4.2	Receive Product at Store
sD4.3	Pick Product from backroom
sD4.4	Stock Shelf
Experiences	
HE.0131	Inventory Management
HE.0253	Stocking plan management
Aptitudes

HA.0030	Facilitation ability
HA.0039	Leadership

Solicitation Methods involves one's ability to request and/or seek bids, proposals, quotations or, requests for information and/or business, but unlike an offer it is only an indication rather than a binding bid. In the context of Source one seeks such information prior to agreeing to, or executing contracts. Solicitation methods can take many forms including electronic but there is a skill in managing a breadth of interest to arrive at an appropriate contract commensurate with the investment needed in the process.

Processes

sS3.1	Identify Sources of Supply
-------	----------------------------

Experiences

HE.0011	Basic Procurement
---------	-------------------

The process of identifying the products or services required and efficiently soliciting and procuring same.

Processes

Section 5

Special Applications

Introduction to GreenSCOR

Sustainable business models and environmental accounting are growing business concerns. However, there are multiple approaches to measuring the total environmental footprint of an organization or supply chain with no agreed upon standards. The SCOR Model, which is a proven framework for defining supply chain scope and process operations as well as measuring supply chain performance, provides an excellent foundation for environmental accounting in the supply chain. In that regard, Supply Chain Council is proposing a set of strategic environmental metrics that can be added to the SCOR Model to effectively allow the SCOR Model to be used as a framework for environmental accounting. The proposed metrics are listed in the table below.

Metric	Units	Basis
Carbon Emissions	Tons CO2 Equivalent	This is the unit of measure currently used for green house gas emissions and is a measure of the climate impact from CO2 and other global warming air emissions.
Air Pollutant Emissions	Tons or kg	This would include emissions of major air pollutants (COx, NOx, SOx, Volatile Organic Compounds (VOC) and Particulate). These are the major emissions that U.S. EPA tracks.
Liquid Waste Generated	Tons or kg	This includes liquid waste that is either disposed of or released to open water or sewer systems (these emissions are generally listed on water emissions permits).
Solid Waste Generated	Tons or kg	The total solid waste generated by the process.
% Recycled waste	Per cent	The per cent of the solid waste that is recycled.

These five metrics can be measured for each of the SCOR level-3 processes and then aggregated to create a level-2 and level-1 metric. These metrics are readily available for most organizations. Environmental agencies and industry associations have developed emissions factors based on process throughput, energy consumption, etc. for calculating these emissions. Alternatively emissions values can be directly collected through monitoring programs or common documents (e.g., regulatory reports, waste shipping documents, environmental permits, etc.).

By adding these metrics to the SCOR Model, an organization can use the existing SCOR based methods for defining supply chain scope and configuration. Once that process is complete, these metrics allow for targeted, structured data collection and calculation of metrics which ultimately provide a total view of supply chain environmental performance. The figure below illustrates the aggregation of these metrics along the SCOR process structure.

Using the SCOR Model as an environmental accounting framework has additional benefits as well. First, the framework clearly ties the various emissions to the originating processes. This provides a structure for not just measuring performance, but identifying where action can be taking to improve performance.

Second, the hierarchal nature of the SCOR Model allows for strategic environmental footprint goals to be easily translated to targets in specific activities. Likewise, when strategic goals are not being met, the framework provides a structure for root cause analysis as well as end-to-end supply chain optimization around environmental performance.

Lastly, as with other SCOR Model metrics, these metrics have clear definitions and a tie to process activities that provide a foundation for effective benchmarking. This capability allows companies to compare environmental performance of their supply chain using the same methods currently used for comparing business performance. Through benchmarking, managers can go beyond measuring environmental performance and understand that performance in the context of their industry peers' performance.

The remainder of this appendix details these environmental metrics and their decomposition levels in the same format used elsewhere in the SCOR Model.

Supply Chain Council believes that this metrics structure provides an effective tool for environmental supply chain accounting. However, this approach is not currently in use, and, therefore, these metrics are not included as fully approved SCOR metrics. Please provide feedback to the Supply Chain Council on the effectiveness of this metrics structure as it is applied to your supply chain operations.

GreenSCOR

Total Supply Chain Carbon Footprint	GS.1.001

GreenSCOR

Return Solid Emissions	GS.3.028
Total Supply Chain % Recycled	GS.2.009
Plan % Recycled	GS.3.029
Source % Recycled	GS.3.030
Make % Recycled	GS.3.031
Deliver % Recycled	GS.3.032
Return % Recycled	GS.3.033
Source % Recycled	GS.3.030

The sum of the carbon equivalent emissions associated with the SCOR Level 2 processes to Plan, Source, Make, Deliver, and Return. Total Supply Chain Carbon Footprint is the sum of emissions from energy and fuel consumption and process related emissions.

Calculation

Total Supply Chain Carbon Footprint = Plan Carbon Emissions + Source Carbon Emissions + Make Carbon Emissions + Deliver Carbon Emissions + Return Carbon Emissions.

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the carbon emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

Hierarchy	
GS.2.001	Plan Carbon Emissions
GS.2.002	Source Carbon Emissions
GS.2.003	Make Carbon Emissions
GS.2.004	Deliver Carbon Emissions
GS.2.005	Return Carbon Emissions

The sum of carbon emissions associated with Plan. Plan carbon emissions can be calculated using published emission factors. In most organizations, the Carbon emissions from the planning process will consist exclusively of energy consumed to support planning tools and infrastructure, including facilities.

Calculation

Plan Carbon Emissions = Sum of Plan Carbon Emissions (for Plan Supply Chain + Plan Source + Plan Make + Plan Deliver + Plan Return)

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

Hierarchy	
GS.3.001	Plan Supply Chain Carbon Emissions
GS.3.002	Plan Source Carbon Emissions
GS.3.003	Plan Make Carbon Emissions
GS.3.004	Plan Deliver Carbon Emissions
GS.3.005	Plan Return Carbon Emissions

The sum of carbon emissions associated with Plan Supply Chain.

Calculation

Plan Supply Chain Carbon Emissions = Sum of Plan Supply Chain Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of carbon emissions associated with Plan Source.

Calculation

Plan Source Carbon Emissions = Sum of Plan Source Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of carbon emissions associated with Plan Make.

Calculation

Plan Make Carbon Emissions = Sum of Plan Make Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of carbon emissions associated with Plan Deliver.

Calculation

Plan Deliver Carbon Emissions = Sum of Plan Deliver Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of carbon emissions associated with Plan Return.

Calculation

Plan Return Carbon Emissions = Sum of Plan Return Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of the carbon emissions associated with Source. This includes the emissions associated with supplier management (material planning, planning procurement staff, supplier negotiation and qualification, etc.) and emissions associated with material acquisition management (bidding and quotations, ordering, receiving, incoming material inspection, material storage, payment authorization, sourcing business rules and requirements, inbound freight and duties, etc.).

Calculation

Source Carbon Emissions = Sum of Carbon Emissions for Supplier Management + Carbon Emissions for Material Acquisition Management

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

Hierarchy	
GS.3.006	Supplier Management Carbon Emissions
GS.3.007	Material Acquisition Management Carbon Emissions

The sum of carbon emissions associated with supplier management.

Calculation

Supplier Management Carbon Emissions = Sum of Supplier Management Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of carbon emissions associated with material acquisition management.

Calculation

Material Acquisition Management Carbon Emissions = Sum of Material Acquisition Management Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of the carbon emissions associated with Make.

Calculation

Make Carbon Emissions = Sum of Carbon Emissions for Direct Production + Carbon Emissions for Indirect Production-related

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

Hierarchy	
GS.3.008	Direct Production Carbon Emissions
GS.3.009	Indirect Production-related Carbon Emissions

The sum of carbon emissions associated with direct production.

Calculation

Direct Production Carbon Emissions = Sum of Direct Production Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of carbon emissions associated with indirect production-related.

Calculation

Indirect Production-related Carbon Emissions = Sum of Indirect Production-related Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of the carbon emissions associated with Deliver and/or Install. This includes the emission associated with sales order management (inquiries & quotations, order entry & maintenance, channel management, order fulfillment, distribution, transportation, outbound freight and duties, installation, customer invoicing/accounting, new product release/phase-in, etc.) and customer management (financing, post-sales customer service, handling disputes, field repairs, enabling technologies, etc.)

Calculation

Deliver Carbon Emissions = Sum of Carbon Emissions for Sales Order Management + Carbon Emissions for Customer Management

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

Hierarchy	
GS.3.010	Sales Order Management Carbon Emissions
GS.3.011	Customer Management Carbon Emissions

The sum of carbon emissions associated with sales order management.

Calculation

Sales Order Management Carbon Emissions = Sum of Sales Order Management Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of carbon emissions associated with customer management.

Calculation

Customer Management Carbon Emissions = Sum of Customer Management Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of the carbon emissions resulting from returning a product to the supplier. This includes the carbon emissions associated with returns to original source (Verify Defective Product Emissions, Disposition of Defective Product Emissions, Identify MRO Condition Emissions, Request MRO Return Authorization Emissions, Schedule MRO Shipment Emissions, Return MRO Product Emissions, etc.) and carbon emissions associated with returns from customers (Authorization Emissions, Schedule Return Emissions, Receive Emissions, Authorize MRO Return Emissions, Schedule MRO Return Emissions, Receive MRO Return Emissions, Transfer MRO Product Emissions, etc.).

Calculation

Cost to Return = Sum of Carbon Emissions for Source Returns + Carbon Emissions for Customer Returns

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

Hierarchy	
GS.3.012	Source Return Carbon Emissions
GS.3.013	Deliver Return Carbon Emissions

The sum of carbon emissions associated with return to source (Source Return).

Calculation

Source Return Carbon Emissions = Sum of Source Return Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of carbon emissions associated with customer returns (Deliver Return).

Calculation

Deliver Return Carbon Emissions = Sum of Deliver Return Carbon Emissions

Data collection

Carbon emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, energy consumption will have to be allocated to various processes based on factors such as square footage, unit volume, revenue, or other factors.

The sum of the air, liquid, and solid waste emissions associated with the SCOR level-2 processes to Plan, Source, Make, Deliver, and Return. Total Supply Chain Environmental Footprint is the sum of air, liquid, and solid waste emissions from energy and fuel consumption and process related emissions less the sum of waste that is effectively recycled.

Calculation

Total Supply Chain Environmental Footprint = Total Supply Chain Air Emissions + Total Supply Chain Liquid Emissions + (Total Supply Chain Solid Waste Emissions * (1 - % waste recycled))

Data collection

Emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations as well as direct waste stream measurement. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources (e.g., smoke stacks or waste generating processes).

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

Hierarchy	
GS.2.006	Total Supply Chain Air Emissions
GS.2.007	Total Supply Chain Liquid Emissions
GS.2.008	Total Supply Chain Solid Emissions
GS.2.009	Total Supply Chain % Recycled

The sum of the air emissions associated with the SCOR level-2 processes to Plan, Source, Make, Deliver, and Return. This includes air emissions from energy and fuel consumption and process related emissions.

Calculation

Total Supply Chain Air Emissions = Plan Air Emissions + Source Air Emissions + Make Air Emissions + Deliver Air Emissions + Return Air Emissions

Data collection

Air emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

Hierarchy	
GS.3.014	Plan Air Emissions
GS.3.015	Source Air Emissions
GS.3.016	Make Air Emissions
GS.3.017	Deliver Air Emissions
GS.3.018	Return Air Emissions

The sum of the air emissions associated with the SCOR level-2 processes to Plan (Plan Supply CHain, Plan Source, Plan Make, Plan Deliver, Plan Return). This includes air emissions from energy and fuel consumption and process related emissions.

Calculation

Plan Air Emissions = Sum of Plan Air Emissions

Data collection

Air emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the air emissions associated with the SCOR level-2 processes to Source. This includes air emissions from energy and fuel consumption and process related emissions.

Calculation

Source Air Emissions = Sum of Source Air Emissions

Data collection

Air emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the air emissions associated with the SCOR level-2 processes to Make. This includes air emissions from energy and fuel consumption and process related emissions.

Calculation

Make Air Emissions = Sum of Make Air Emissions

Data collection

Air emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the air emissions associated with the SCOR level-2 processes to Deliver. This includes air emissions from energy and fuel consumption and process related emissions.

Calculation

Deliver Air Emissions = Sum of Deliver Air Emissions

Data collection

Air emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the air emissions associated with the SCOR level-2 processes to Return. This includes air emissions from energy and fuel consumption and process related emissions.

Calculation

Return Air Emissions = Sum of Return Air Emissions

Data collection

Air emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on energy consumption, fuel type and consumption, or process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the liquid emissions associated with the SCOR level-2 processes to Plan, Source, Make, Deliver, and Return. This includes liquid emissions from process related emissions.

Calculation

Total Supply Chain Liquid Emissions = Plan Liquid Emissions + Source Liquid Emissions + Make Liquid Emissions + Deliver Liquid Emissions + Return Liquid Emissions

Data collection

Liquid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

Hierarchy	
GS.3.019	Plan Liquid Emissions
GS.3.020	Source Liquid Emissions
GS.3.021	Make Liquid Emissions
GS.3.022	Deliver Liquid Emissions
GS.3.023	Return Liquid Emissions

The sum of the liquid emissions associated with the SCOR level-2 processes to Plan. This includes liquid emissions from process related emissions.

Calculation

Plan Liquid Emissions = Sum of Plan Liquid Emissions

Data collection

Liquid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the liquid emissions associated with the SCOR level-2 processes to Source. This includes liquid emissions from process related emissions.

Calculation

Source Liquid Emissions = Sum of Source Liquid Emissions

Data collection

Liquid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the liquid emissions associated with the SCOR level-2 processes to Make. This includes liquid emissions from process related emissions.

Calculation

Make Liquid Emissions = Sum of Make Liquid Emissions

Data collection

Liquid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the liquid emissions associated with the SCOR level-2 processes to Deliver. This includes liquid emissions from process related emissions.

Calculation

Deliver Liquid Emissions = Sum of Deliver Liquid Emissions

Data collection

Liquid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the liquid emissions associated with the SCOR level-2 processes to Return. This includes liquid emissions from process related emissions.

Calculation

Return Liquid Emissions = Sum of Return Liquid Emissions

Data collection

Liquid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the Solid emissions associated with the SCOR level-2 processes to Plan, Source, Make, Deliver, and Return. This includes solid emissions from process related emissions.

Calculation

Total Supply Chain Solid Emissions = Plan Solid Emissions + Source Solid Emissions + Make Solid Emissions + Deliver Solid Emissions + Return Solid Emissions

Data collection

Solidemissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

Hierarchy	
GS.3.024	Plan Solid Emissions
GS.3.025	Source Solid Emissions
GS.3.026	Make Solid Emissions
GS.3.027	Deliver Solid Emissions
GS.3.028	Return Solid Emissions

The sum of the Solid emissions associated with the SCOR level-2 processes to Plan. This includes solid emissions from process related emissions.

Calculation

Plan Solid Emissions = Sum of Plan Solid Emissions

Data collection

Solid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the Solid emissions associated with the SCOR level-2 processes to Source. This includes solid emissions from process related emissions.

Calculation

Source Solid Emissions = Sum of Source Solid Emissions

Data collection

Solid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the Solid emissions associated with the SCOR level-2 processes to Make. This includes solid emissions from process related emissions.

Calculation

Make Solid Emissions = Sum of Make Solid Emissions

Data collection

Solid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the Solid emissions associated with the SCOR level-2 processes to Deliver. This includes solid emissions from process related emissions.

Calculation

Deliver Solid Emissions = Sum of Deliver Solid Emissions

Data collection

Solid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The sum of the Solid emissions associated with the SCOR level-2 processes to Return. This includes solid emissions from process related emissions.

Calculation

Return Solid Emissions = Sum of Return Solid Emissions

Data collection

Solid emissions are generally calculated using emission factors such as those created by the U.S. Environmental Protection Agency, National Environmental Research Laboratory, and various industry associations. The emission factors are generally based on process throughput. Alternatively, actual emissions can be monitored from discrete sources.

Discussion

Often, a supply chain represents partial use of a facility, production line, vehicle, etc. Therefore, the emissions from this infrastructure must be apportioned based on the proportional use of the supply chain.

The portion of the solid waste effectively recycled or reused associated with the SCOR level-2 processes to Plan, Source, Make, Deliver, and Return. This is the total solid waste emissions that are effectively recycled as a percentage of the total solid waste emissions.

Calculation

Total Supply Chain % Recycled = (Plan % Recycled * Plan Solid Waste Emissions + Source % Recycled * Source Solid Waste Emissions + Make % Recycled * Make Solid Waste Emissions + Deliver % Recycled * Deliver Solid Waste Emissions + Return % Recycled * Return Solid Waste Emissions) / Total Supply Chain Solid Waste Emissions

Data collection

The amount of solid waste that is recycled is generally available through process records for reuse or invoices or bills of lading from recycling partners.

Discussion

This metric is intended to measure the waste that is actually recycled rather than the waste that can be recycled. It is intended to reflect the true current environmental performance of the supply chain.

Hierarchy	
GS.3.029	Plan % Recycled
GS.3.030	Source % Recycled
GS.3.031	Make % Recycled
GS.3.032	Deliver % Recycled
GS.3.033	Return % Recycled

The portion of the solid waste effectively recycled or reused associated with the SCOR level-2 processes to Plan. This is the total solid waste emissions that are effectively recycled as a percentage of the total solid waste emissions.

Calculation

Plan % Recycled = (Sum of Plan Recycled) / (Sum of Plan Solid Waste Emissions)

Data collection

The amount of solid waste that is recycled is generally available through process records for reuse or invoices or bills of lading from recycling partners.

Discussion

This metric is intended to measure the waste that is actually recycled rather than the waste that can be recycled. It is intended to reflect the true current environmental performance of the supply chain.

The portion of the solid waste effectively recycled or reused associated with the SCOR level-2 processes to Source. This is the total solid waste emissions that are effectively recycled as a percentage of the total solid waste emissions.

Calculation

Source % Recycled = (Sum of Source Recycled) / (Sum of Source Solid Waste Emissions)

Data collection

The amount of solid waste that is recycled is generally available through process records for reuse or invoices or bills of lading from recycling partners.

Discussion

This metric is intended to measure the waste that is actually recycled rather than the waste that can be recycled. It is intended to reflect the true current environmental performance of the supply chain.

The portion of the solid waste effectively recycled or reused associated with the SCOR level-2 processes to Make. This is the total solid waste emissions that are effectively recycled as a percentage of the total solid waste emissions.

Calculation

Make % Recycled = (Sum of Make Recycled) / (Sum of Make Solid Waste Emissions)

Data collection

The amount of solid waste that is recycled is generally available through process records for reuse or invoices or bills of lading from recycling partners.

Discussion

This metric is intended to measure the waste that is actually recycled rather than the waste that can be recycled. It is intended to reflect the true current environmental performance of the supply chain.

The portion of the solid waste effectively recycled or reused associated with the SCOR level-2 processes to Deliver. This is the total solid waste emissions that are effectively recycled as a percentage of the total solid waste emissions.

Calculation

Deliver % Recycled = (Sum of Deliver Recycled) / (Sum of Deliver Solid Waste Emissions)

Data collection

The amount of solid waste that is recycled is generally available through process records for reuse or invoices or bills of lading from recycling partners.

Discussion

This metric is intended to measure the waste that is actually recycled rather than the waste that can be recycled. It is intended to reflect the true current environmental performance of the supply chain.

The portion of the solid waste effectively recycled or reused associated with the SCOR level-2 processes to Return. This is the total solid waste emissions that are effectively recycled as a percentage of the total solid waste emissions.

Calculation

Return % Recycled = (Sum of Return Recycled) / (Sum of Return Solid Waste Emissions)

Data collection

The amount of solid waste that is recycled is generally available through process records for reuse or invoices or bills of lading from recycling partners.

Discussion

This metric is intended to measure the waste that is actually recycled rather than the waste that can be recycled. It is intended to reflect the true current environmental performance of the supply chain.

The portion of the solid waste effectively recycled or reused associated with the SCOR level-2 processes to Source. This is the total solid waste emissions that are effectively recycled as a percentage of the total solid waste emissions.

Calculation

Source % Recycled = (Sum of Source Recycled) / (Sum of Source Solid Waste Emissions)

Data collection

The amount of solid waste that is recycled is generally available through process records for reuse or invoices or bills of lading from recycling partners.

Discussion

This metric is intended to measure the waste that is actually recycled rather than the waste that can be recycled. It is intended to reflect the true current environmental performance of the supply chain.
