- **Final thoughts**

Insights from the The Energy Ladder Research, Uganda

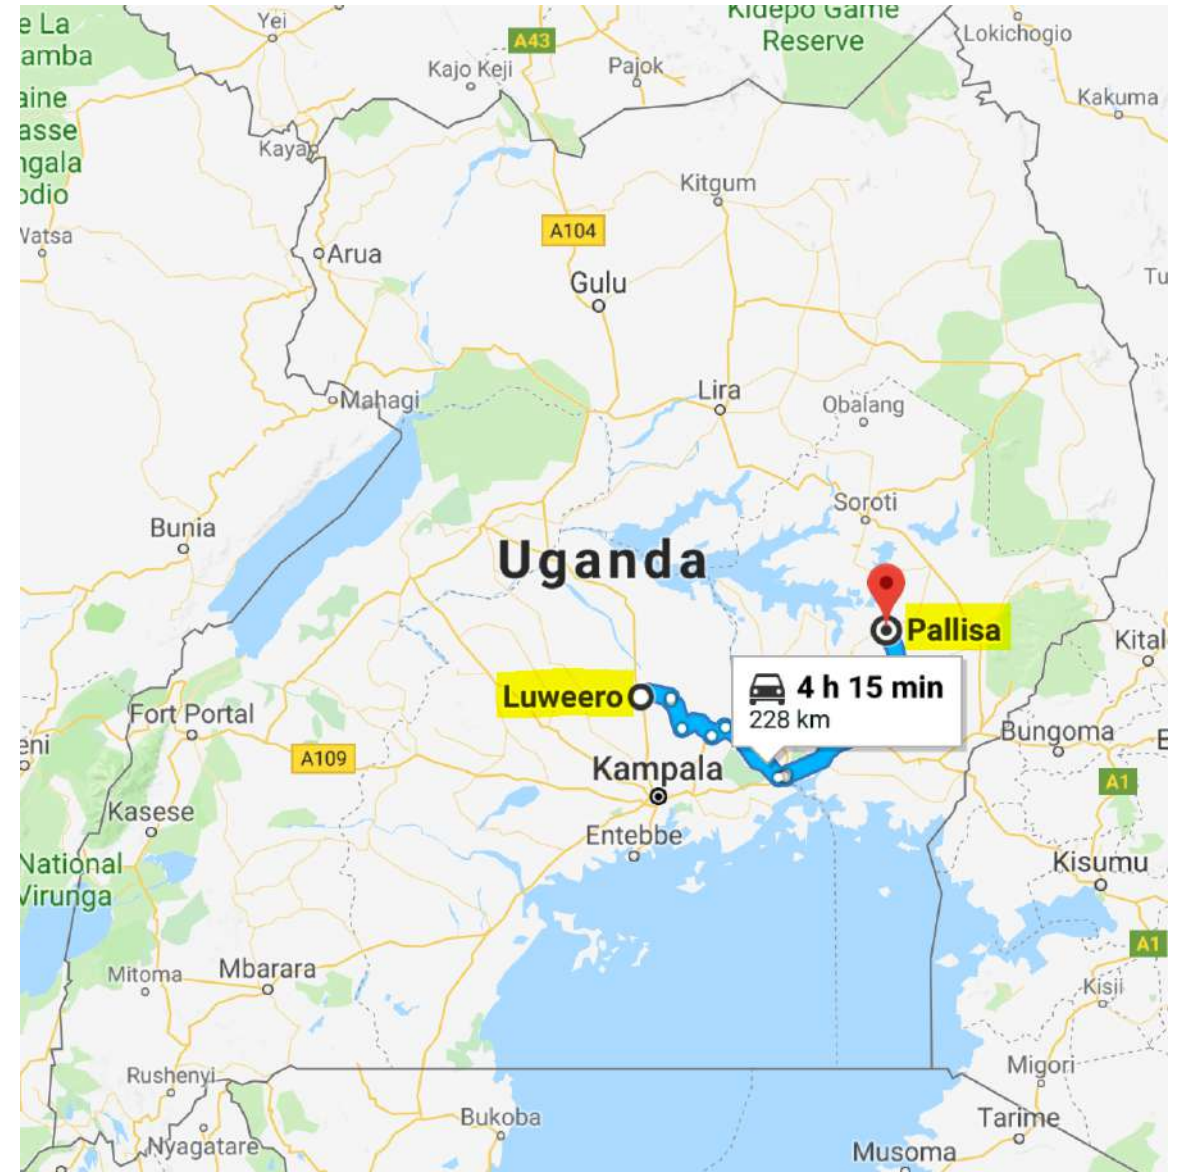

Richa Goyal
Schatz Energy Research Center

A Peek into our Rural Customer Base
Global off-Grid Solar Forum & Expo
January 23, 2018

Contents

1. Set a quick context of the off-grid electricity situation in Uganda
2. Ways in which end-users adopt higher levels of solar energy access
3. Motivations for purchase
4. User preferences for subsequent purchases

Who were the respondents

Level 3: Large
solar home
system owners
(162
respondents)

Level 2:
*Small solar home system
kit owners (166
respondents)*

Level 1: Solar portable lamps(SPL) owners
(226 respondents)

Constructing the notional solar energy ladder in the sampling plan

Research methods and timeline

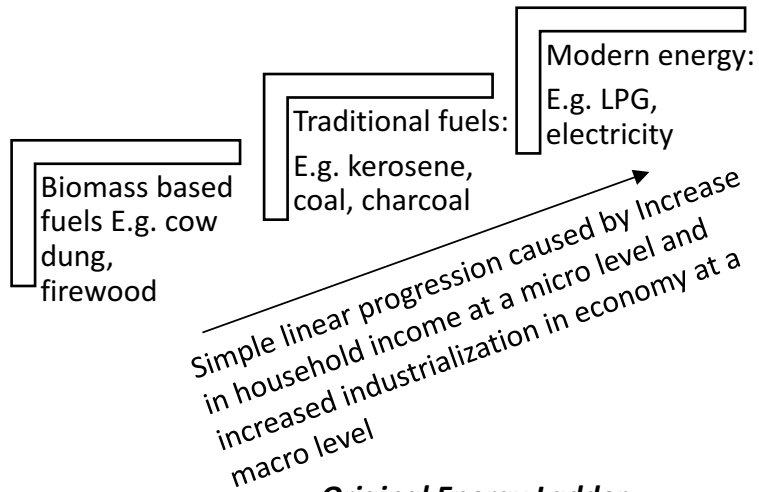

Key insights

1. We reject the solar energy ladder hypothesis. Low income households can leap to higher level of solar energy access directly if appropriate financing instruments is made available to them.
2. We observe mixed stacking and fuel switching behavior among users.
3. Fulfilling lighting energy demand by stacking lighting products, and buying components to expand existing system capacity are popular solar product purchases.
4. Direct marketing, referrals and demonstration effect, play a big role in sales.
5. Users prefer to avoid flexible financing for subsequent purchases.

Solar product adoption patterns

Solar Energy Ladder?

Original Energy Ladder

The energy ladder hypothesis was adapted into a hypothetical construct of a 'solar' energy ladder

Diagram showing the conceptual solar energy ladder

Energy Stacking (solar with tradition fuels)

Energy stacking?

Energy Stacking (solar with solar)

Solar energy ladder hypothesis does not hold!

Percentage of respondents that purchased a solar product for the first time in the year 2015

	Respondents that bought their first product in 2015	Total respondents	%
Level 1	221	226	98%
Level 2	163	166	98%
Level 3	150	162	93%

Annual income in USD of respondents across different levels of solar energy access

Use of solar and traditional fuels show a mixed stacking and fuel switching behavior

Savings in energy spending on status-quo fuels

Respondents' use of non-solar energy fuels and technologies

Plot shows within-level percentage. E.g. 40% Level 1 respondents stopped using status-quo fuels and technologies and shifted to solar off-grid product(s). Respondents can use more than one status-quo fuels and technologies.

Within-solar product stacking - solar off-grid energy adoption trends over time

Individual trends lines for daily energy use in Wh across all solar systems owned by respondents

Note: Graph has been zoomed to optimize graphing area. Some outliers have been excluded. Some Level 3 respondents have daily energy service exceeding 400 Wh.

Within-solar product stacking – who bought what

Popular solar energy products bought by subsequent purchasers (respondents that bought at least one other solar energy product between baseline (May-Jun, 2015) and endline (Feb, 2017) surveys.

Level of solar energy access	Overall actual purchasers	Systems with lights	Overall actual adoption rate	Light adoption rate	Components bought to expand current solar system	System expansion rate
Level 1	44	40	22%	91%	0	0%
Level 2	26	15	18%	58%	6	23%
Level 3	22	9	15%	41%	3	14%
Total	92	64	18%	70%	9	10%

A thin vertical line is positioned to the left of the text.

Motivations for purchase

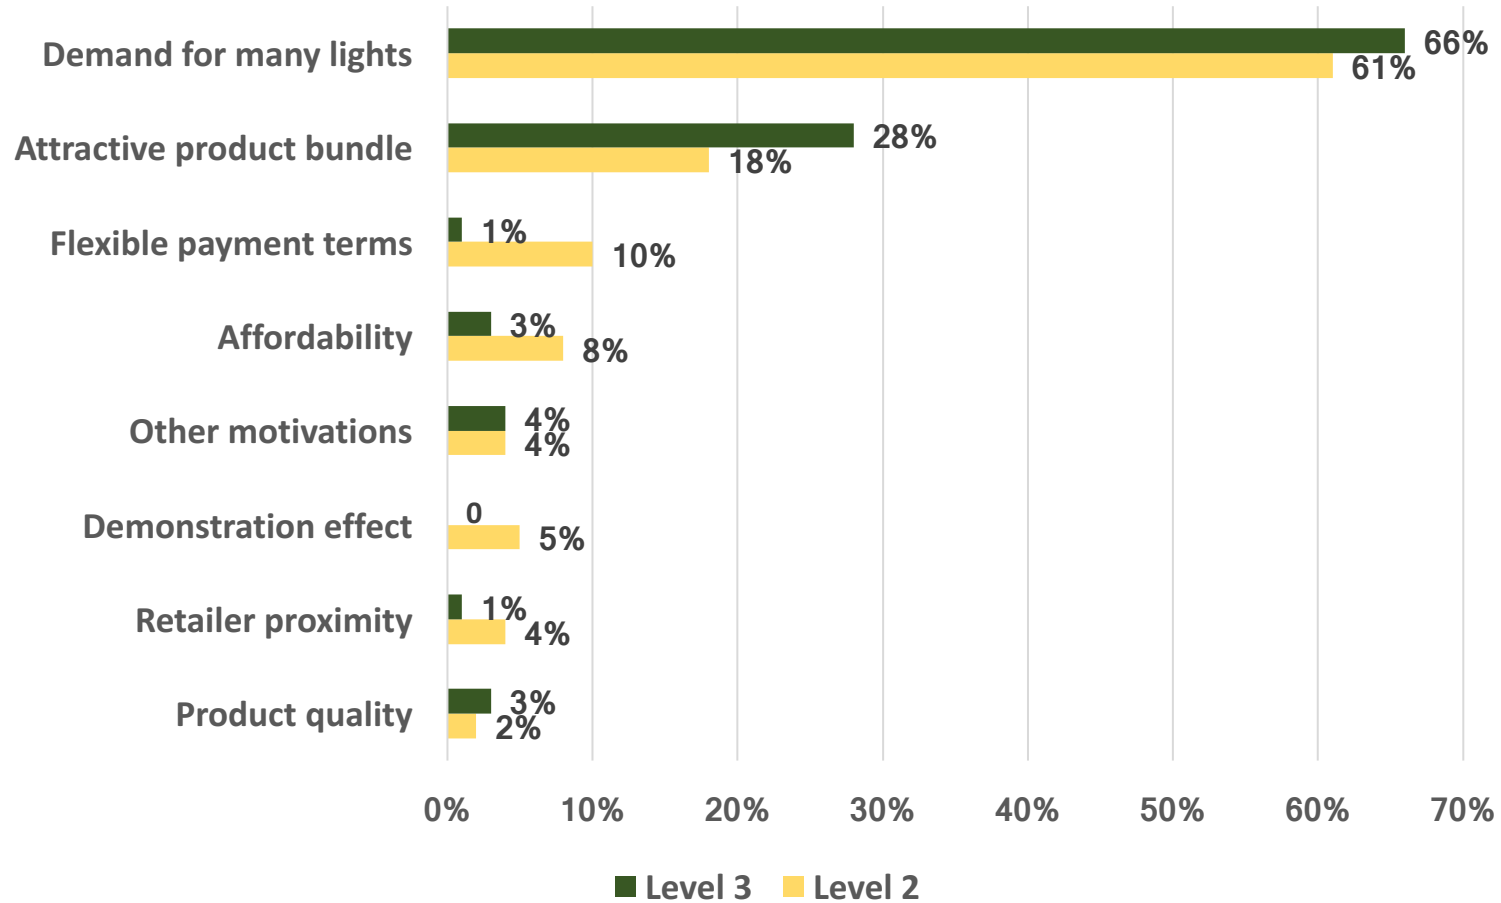

Key prior experiences or information that influenced users to purchase each of the solar products they own

Note: Respondents could report more than one influencing factor.

Motivations for purchasing a solar home system as the first solar product

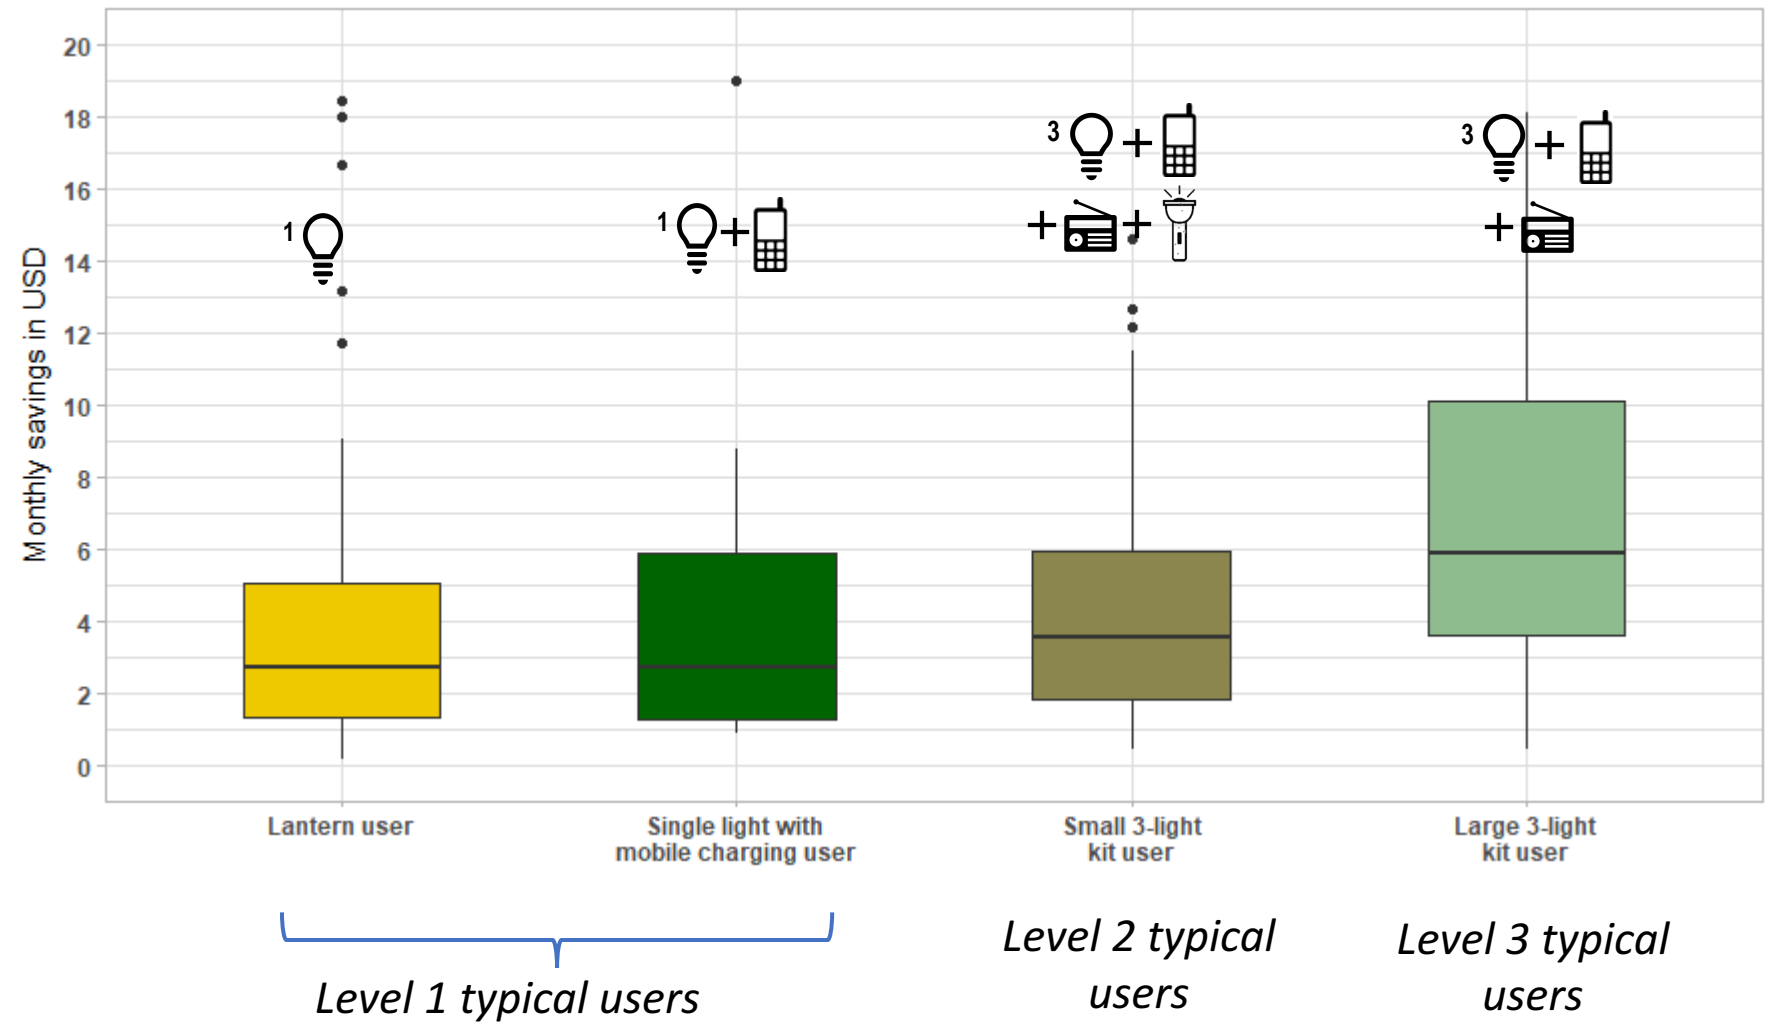

Reasons why Level 2 and Level 3 respondents bought a solar home system in their first product purchase

Note: Graph reports within level percentages. E.g. 66% Level 3 respondents bought a big system because they had demand for many lights. Respondents could report more than one motivation.

Is motivation for purchase an economic one? - Net present value (NPV) analysis for typical customers

Graph shows monthly savings for typical customers of each level of solar energy access

Is motivation for purchase an economic one? - Net present value (NPV) analysis for typical customers cont.

Results of a net present value analysis

Solar Product Adopted in 2015	Level of solar energy access	Solar scenario description		NPV over two years in 2015 money	Break-even period if less than 2 years	Comments
		Payment method for solar product	Median monthly savings due to avoided spending on status-quo fuels			
Simple lantern	Level 1	Complete upfront payment of \$10	\$2.76	\$ 56.84	4 months	Almost 5.7x benefit over two years
Single light with mobile charging		Complete upfront payment of \$24.2	\$2.76	\$ 40.62	10 months	Almost 1.6x benefit over two years
Small 3-light kit (10 W solar module)	Level 2	Complete upfront payment of ~\$196	\$3.61	-\$151.66	N/A	There is net cash outflow during the analysis period (2 years).
		PAYG payment plan: Down payment: \$18; Monthly payment: ~\$10; Repayment period: 18 months	\$3.61	-\$127.85	N/A	
Large 3-light SHS with TV (50 W solar module)	Level 3	Complete upfront payment of ~\$546	\$5.25	-\$541.43	N/A	There is substantial net cash outflow during the analysis period (2 years).
		Micro-credit payment plan: Down payment: ~\$117; Monthly payment: ~\$28.50; Repayment period: 24 months	\$5.25	-\$735.39	N/A	

Preferences for
subsequent purchases

Users' preferences for subsequent purchase of energy product(s): Summary

This Table summarizes some of the key highlights from the 'subsequent purchase analysis'

Key metrics	Level 1	Level 2	Level 3
Preference for upfront payment using personal savings	98%	97%	95%
Dealer stickiness	24%	74%	73%
Preference to purchase from a different 'known' dealer	9%	2%	4%
Preference for PAYG as financing method	0%	0%	0%
Preference to purchase non-solar energy products or take utility grid connection	<1%	<1%	0%

Escaping Darkness: Consumer Value in PAYGo Solar

Daniel Waldron

January 23, 2018

*“...everyone likes light. It is
important, especially at night.
You can’t stay in darkness!”*

Tanzanian PAYGo user

Context

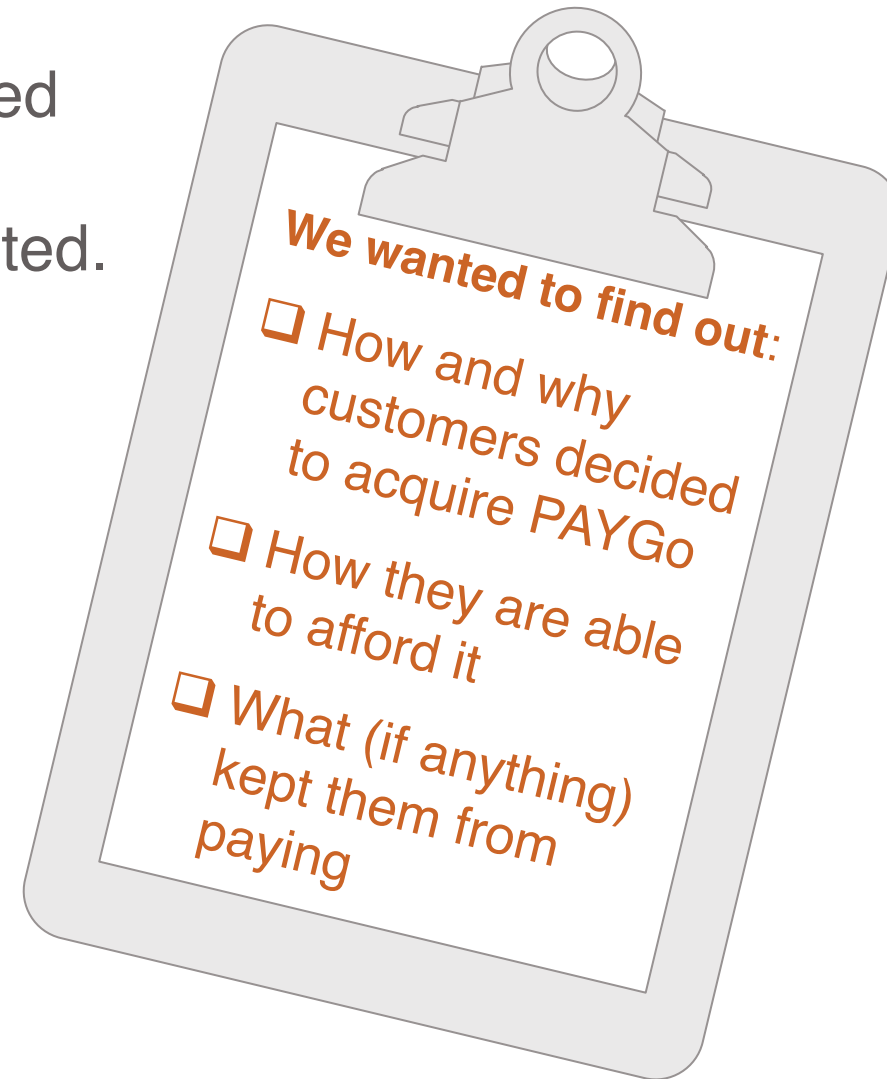

Motivation

PAYGo sector has emphasized user net savings, but the story appears more complicated.

Median household spending
in the Kenya Financial Diaries

There was a need to better understand household financial dynamics

We interviewed 138 rural households in Kenya, Tanzania, Ghana and Cote d'Ivoire

We worked with four providers who graciously helped us to identify low-income and/or struggling customers, and then allowed us to speak directly with their customers

Results

PAYGo providers allow customers to invest in transforming their own lifestyles

Users adopted
PAYGo solar to
escape darkness

“Even before saying [I have solar], when a visitor comes here, he says, ‘Hey you’ve got solar!’ and it makes me so happy.”

Literally, they
wanted better,
cleaner lighting

“We were used to the tin lamp but now when I see how the solar lights the house, I wonder how we used to survive before....”

Figuratively,
they wanted to
be connected

“I like the solar because it gives me access to information. That’s it.”

*“I have light,
my friends
can [charge
their phones]
and that is
development.”*

We cannot overstate the importance of consumer finance, of being able to pay over time

“[Paying in installments] is very important, because if they asked us to pay [all at] once it will not be possible as we cannot afford it.”

Users felt that PAYGo providers had placed trust in them, and valued that relationship

“You can be given something but the way you are talked to will either make you want to pay for it or not. They have good language and are not abusive.”

*“[The solar]
is good even
if it is more
expensive.”*

**For most, a PAYGo acquisition
had not resulted in savings
during the loan.**

Interviewer: *“Do you think [your solar home system] has saved you money?”*

Respondent: *“I cannot compare because I used little money to buy kerosene. [Solar] is much better than using [the kerosene] lamp.”*

**Few households were struggling
to pay; customers reduced
consumption, tapped savings,
and used the flexibility of PAYGo**

“What I have done is, when we cook rice during the day we eat half for both lunch and supper. That is how we economize. If the solar had affected our life so much, I would have told them to come and take it away.”

These results are consistent with other findings

“it’s not always the case that customers make savings. Families can spend more for energy after purchasing a more powerful SHS during the repayment period”
– Acumen, 2017

“For solar home systems... the payback period may be longer or there may not be a net reduction in lighting expenditure. However, the direct financial comparison between electric and kerosene lighting does not consider the qualitative difference in lighting.”
– SE4All, 2017

*“[My wife]
refused, saying
[the solar] will
give us problems.
I called customer
care anyway...”*

Across all markets, it was men who made the decision to acquire solar, often against the initial protests of their wives

Interviewer: “Did you come home and consult with your wife?”

Respondent: “I made a mistake and decided to buy it right there and when I came home I told her, ‘Look! I have got solar and they have said we pay \$0.53 daily!’ But it has not been easy!”

Recurrent payments often came out of women’s budgets

“When [she] wants to go to the market, instead of taking a motorbike, she prefers to walk so that we can use that money to pay for solar.”

“It is not as we had agreed on in the written contract.”

PAYGo products are complex, leaving customers vulnerable to misunderstandings or misrepresentations.

“I was supposed to pay \$31.59 as deposit and \$0.57 daily. But [the agent] only said [to pay] \$22.73...Now I am wondering if the documents were inaccurate.”

Interviewer: *“What does [the solar company] say in the text message when you make payment?”*

Respondent: *“They state the amount that has been paid so far but not the balance.”*

“There was a paper signed, but I did not read because I don’t know how to read English.”

A photograph of a compact fluorescent light bulb (CFL) hanging from a wire. The bulb is white with a black base and is positioned on the right side of the frame. The background is a rusty, brown metal surface. A thin, light-colored wire runs horizontally across the upper part of the image. The text "High Level Takeaways" is overlaid in white on the lower left portion of the image.

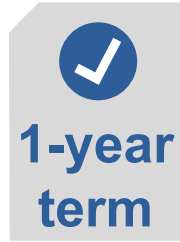

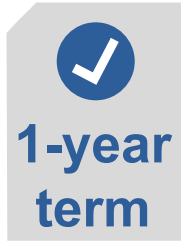

High Level Takeaways

Longer tenors are not necessarily the best way to reach low-income customers

v.

Daily cost of energy	Ability to offer larger products affordably	Default risk*	Cost of capital*	Time to upgrade, offer other services
				
Lower	Greater	Lower	Lower	Shorter

Who are we reaching? And why does it matter?

It is possible to go down-market, but it will not happen without strategic planning and long-term effort

The value here is in long-term relationships. You have to be kind, and you have to be transparent

Understand what behaviors build trust, and emphasize those at every opportunity

*“The solar has benefits, and
there is a saying that everything
good is worth the price.”*

Ghanaian PAYGo customer

Thank You!

AN INITIATIVE OF
WORLD BANK GROUP
THE WORLD BANK IFC

First round of discussions

A Peek into our Rural Customers

*A Deep-dive of Ethiopia,
Kenya and Tanzania Markets
in Africa*

Presenter: Samuel Muthoka
Ipsos Tanzania

LA STUDIES IN KENYA, ETHIOPIA & TANZANIA

Commissioned by the World bank group, The LA research projects in Kenya, Ethiopia and Tanzania have happened over the last two years

Main objective was to understand trade penetration, deep-dive in trader and consumer dynamics

March - Aug 2016
SCOPE: 8,167 outlets

Nov 2015 –April 2016
SCOPE: 29,832 outlets

Jan – December 2017
SCOPE: 9,512 outlets

KEY INDICATORS: ETHIOPIA

GAME CHANGERS

- **56 Million** – Target consumer Market (15+)
- **76%** - Have primary level education and below
- **59%** - Seasonal income through agriculture and menial work
- **44%** - Mobile phone penetration (79% of population have access to mobile)
- **<20%** - connected to grid electricity
- **5%** - Trade channel penetration for Solar lighting products
 - **79%** of these outlets pushing Lanterns, 35% pushing Home Kits
- **Lanterns: 335 Brands** in the formal trade market
 - 11% LA Associates, 89% non associates.
- **Home Kits: 308 brands** in the informal market
 - 8% - LA Associates, 92% non-associates

Large market, developing trade networks, itinerant distribution, COUNTERFEIT

Strong standards, higher consumer awareness

- **25 Million** – Target consumer Market (16+)
- **60%** - Primary level education and below
- **50%** - Seasonal income through agriculture and menial work
- **31%** - Education most important goal in life
- **30%** - Rely on social networks for coping mechanisms
- **95%** - Have access to mobile telephony at HH level
- **21%** - Trade Channel penetration for Solar lighting solutions
 - 79% of these channels pushing Lanterns, 37% pushing Home kits
- Solar lanterns: 150 brands in the formal market
 - 54% - LA Associate brands, 46% - Non-associate brands
- Home Kits: 59 Brands in the formal trade market
 - 48% - LA Associate brands, 52% - Non associate brands

Strong distribution networks, drive for higher capacity systems, challenge of counterfeits

- **29 Million** – Target consumer Market (16+)
- **79%** - Have primary level education and below
- **60%** - Seasonal income through agriculture and menial work
- **31%** - Health and education
- **56%** - Cut down on spending as a coping mechanisms, 40% rely on social networks
- **95%** - Have access to mobile telephony at HH level
- **46%** - Access to Grid Electricity
- **14%** - Trade Channel penetration for Solar lighting solutions
 - 79% of these outlets pushing Lanterns, 35% pushing Home Kits
- **Lanterns: 148 Brands** in the formal market
 - 17% - LA Associates brands, 83% - non-associates brands
- **Home Kits: 70 Brands** in the formal trade market
 - 44% LA Associates brands 56 % - non-associates brands

CONSUMER ACCESS IS HOWEVER MULTI-FACETED

Informal access is significantly higher than mainstream trade access – and more driven by home kits than lanterns – through credit. This is explained by thriving social networks and seasonality of income, which agents leverage on

Route to Market – Consumer purchase points

NON-TRADE CHANNELS RELY ON RURAL ECONOMY AND TRUST TO PUSH THEIR BRANDS

Market Approach

- Door to door selling
- Target both urban and rural areas

Volumes Moved

- Agents move about 12-40 units per month depending on the size of the unit and demand

Main Products Moved

- Majority move the solar kits
- Kits with TV are said to be of higher demand
- Solar lanterns have the least demand

Agent Payment

- Agents are paid on commission based on the units that they push

Customers Payment Modules

- Credit facilities are accepted where by a down payment is done and later on monthly/weekly/daily instalments are paid within 2-3 years
- Cash is also accepted and is a bit cheaper compared to buying on credit

Stock Movement

- Agents move around with stock
- Stock is taken from the main office /branch
- Agents cater for their own transport

LANTERNS MORE POPULAR AMONG KENYA CONSUMERS (88% Lanterns, 12% Solar Kits), SOLAR HOME KITS MORE POPULAR AMONG TANZANIA CONSUMERS

A deep dive in Tanzania Consumers

n=1378

INCREMENTAL NEEDS NOW A KEY PURCHASE DRIVER FOR RURAL CONSUMERS

Price and multi functionality of the brand are key determinants on what solar products to purchase- this is linked to consumers financial capacity and the brands capability to cater for the basic needs of the households such as lighting, charging phones etc.

MULTI FUNCTIONALITY OF THE PRODUCT

"...before I buy solar I look at if the product is able to perform a variety of services at the same time e.g. lighting a room and charging a phone"

"....nowadays life is tough there is no loose money so I will buy a product that is not too expensive- Arusha"

PRICE

Quality

Brightness of the light

ACCESSIBILITY

Promotions/ discounts

"...I will buy a product that I can easily get close to where I live because I do not want to incur transport costs- Tanga"

"...when I go to the shop I usually look at products that I can easily afford and products that have warranty- Mwanza"

PRODUCT WARRANTY

"... last time I went to buy my solar lantern I asked the retailer to light it so as I can see the brightness of the light because I wanted a lantern that emits enough light - Singida"

"...for me I will purchase a product that I am sure I will get the after sale service. For example I have M-PAWA product and anytime I have a problem I will call the technicians and they will come right away - Mwanza"

PRODUCT QUALITY IS DISQUIET AMONG A THIRD OF CONSUMERS

Faint light from the solar products has been one of the greatest challenge that more than quarter (43%) of the households surveyed faced when using the solar products

Please tell me, have you ever had any issues with your solar lighting products?

EXPERIENCED PROBLEM WITH THE SOLAR PRODUCT

What issues have you had with your solar lighting product(s)?

SOLAR PROBLEM EXPERIENCED

CONSUMERS TOP CONCERNS – FOR IMPROVEMENT: SIMILAR ACROSS TIERS

More than half of the households surveyed have recommended for a reduction in price on the solar products. Other concerns included brightness of light and a longer duration of lighting of the solar products

Q25. What do you think can be done to improve your experience with solar lighting products?

COST IS A BIG CHALLENGE

- There is willingness to pay for higher capacity products, but cost is a barrier to rural consumers.

QUALITY = TARGET POPULATION

- 'QUALITY' as a stand alone attribute is not a concept the mass market understand well, rather they have issues with low level of brightness, batteries not charging and short lighting span – all which define product quality (all these issues worry consumers)
- Sales agents driven purchases carry the day – low quality, unverified products, but cheap

MARKET IS MOVING FROM PICO TO HIGHER CAPACITY SYSTEMS

- Need driven by multiple functions. The future is in higher capacity home systems (at an affordable price)

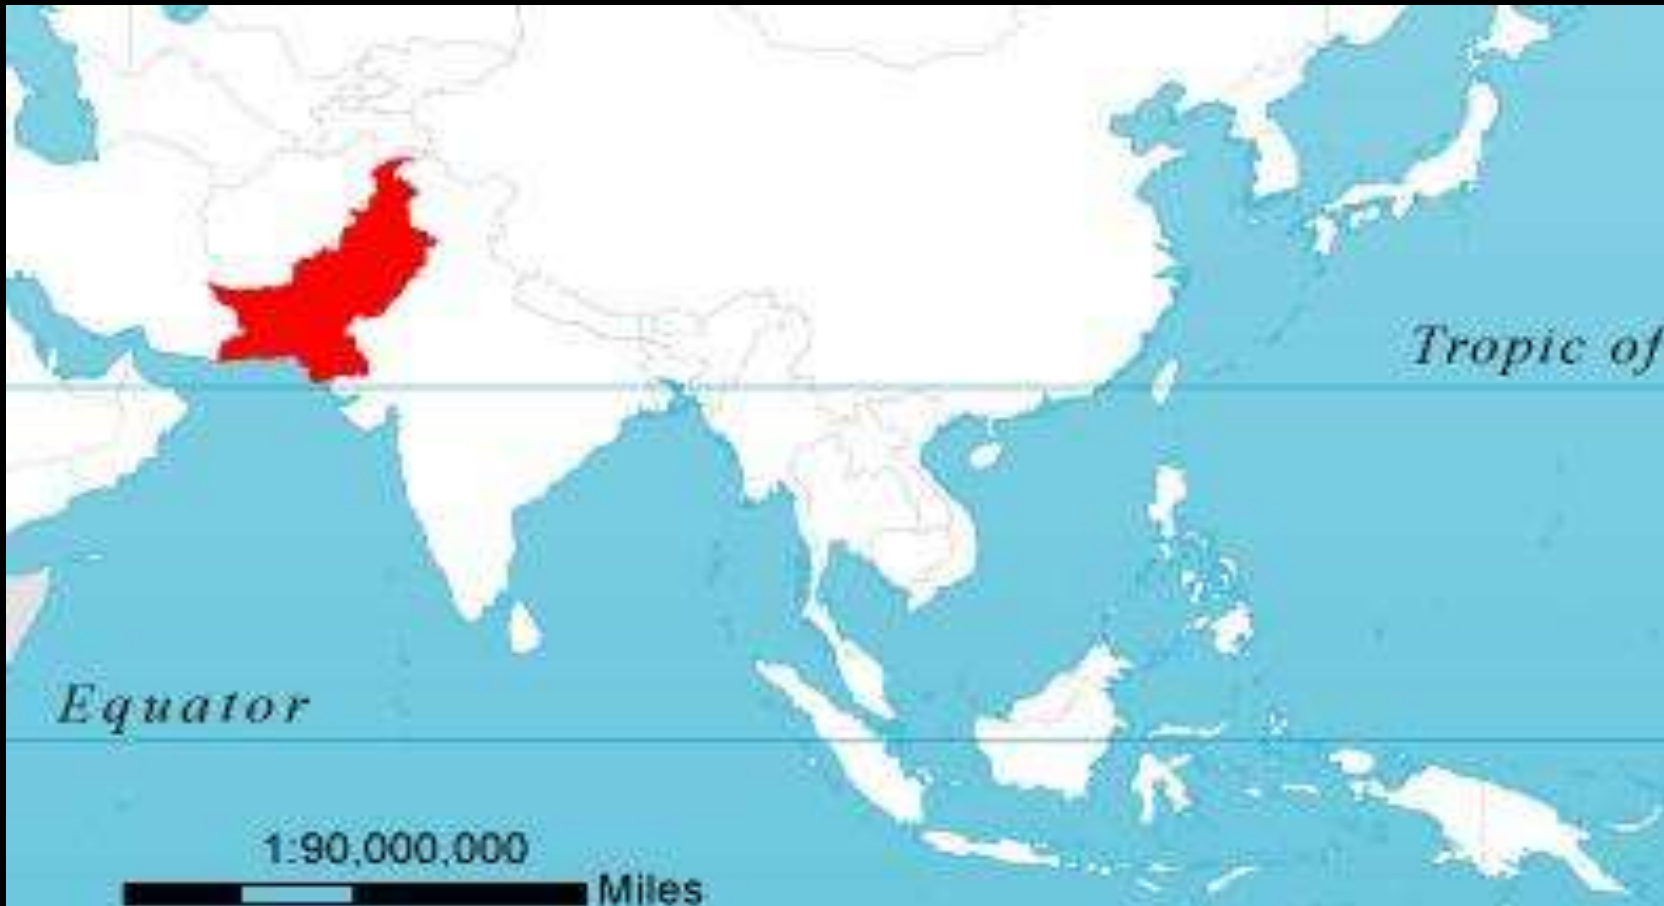

COMMUNICATION TARGETING

- Repeat purchase and upgrade to higher capacity systems
- Target Informal distribution networks (training days? Incentives? Accreditation?)

CASE STUDY: EcoEnergy

Successfully implementing Pay-As-You-Go solar in Pakistan

Shazia Khan /// CEO and coFounder of EcoEnergy

Pakistan: Country Overview

200 Million people

6th largest country in world

64% population under 30

Pakistan: Energy Access Picture

70 million off-grid

71 million under-electrified

1.2 million businesses off-grid

No grid expansion plan

\$2.2b/year spent on energy
alternatives

The problem:

to create a commercially viable business model for off-grid electrification in Pakistan.

CONSUMER

OTHER BARRIERS TO SCALE

The problem: Financial

NO WORKING CAPITAL

EQUITY INVESTORS PERCEIVE PAKISTAN AS RISKY

(After relentless and time-consuming lobbying)
financing solutions slowly beginning to emerge

DFI LOAN GUARANTEES

DEBT FUNDS FOR PAYGOS

PROFIT SHARING

The problem: Regulatory

GENERAL SALES TAX

IMPORT DUTY

INCONSISTENCY BETWEEN CUSTOMS RULES MAKES IT DIFFICULT TO PLAN

Partnerships with valuable advocates
provides entrance to stakeholder meetings with Pakistani government
officials

Growth

- 15,000 solar lanterns 2014-2016
- 1500 shs in 2017
- 10000 shs in 2018
- 50000 shs in 2019

Consistent month/month growth, except for May 2017, due to stock-out.

Slowly overcoming foreign perspective on Pakistan

Investment Climate and Political Stability

Improving investment climate

- Morgan Stanley updated from Frontier to Emerging Market
- FDI increased by 5% to \$2.4b in FY17
- Major inflows from Netherlands, France, UK

Moving towards long-term political stability

- 1st democratic elections held in 2013
- Disqualification and ouster of Prime Minister on charges of corruption

The future

(...not totally relevant, just miss that guy.)

Thank you.
