GENERAL DESCRIPTION

The ADL8141-EVALZ is a 4-layer printed circuit board (PCB) fabricated from 8 mil thick, Rogers 4003C and Isola 370HR, copper clad, forming a nominal thickness of 62 mils. The RFIN and RFOUT ports on the ADL8141-EVALZ are populated with female coaxial 2.4 mm connectors, and the corresponding RF traces have a 50 Ω characteristic impedance. The ADL8141-EVALZ is populated with components suitable for use over the entire -40°C to $+85^{\circ}\text{C}$ operating temperature range of the [ADL8141](#). To calibrate board trace losses, a through calibration path is provided between the J1 and J2 connectors. J1 and J2 must be populated with 2.4 mm RF connectors to use the through calibration path. Refer to [Table 1](#) and [Figure 3](#) for the through calibration path performance.

Connect ground and power to ADL8141-EVALZ using the surface-mount technology (SMT) test point connectors, GND and VDD. A supplementary test point for VBIAS is included for simple access on the RBIAS pin (see [Figure 5](#) for the test point assembly).

The package ground leads and the exposed pad connect directly to the ground plane. Multiple vias connect the top and bottom ground planes with particular focus on the area directly beneath the ground paddle to provide adequate electrical conduction and thermal conduction.

The power supply decoupling capacitors on the ADL8141-EVALZ represent the configuration used to characterize and qualify the device.

For full details on the ADL8141, see the ADL8141 data sheet, which must be consulted in conjunction with this user guide when using the ADL8141-EVALZ evaluation board.

REVISION HISTORY**7/2023—Revision 0: Initial Version**

OPERATING THE ADL8141-EVALZ

A 2 V, 100 mA power supply is required to provide the bias to the ADL8141 when using the ADL8141-EVALZ. Connect the 2 V power supply to the SMT test point, VDD. Connect the ground reference to the GND test point. Apply the RF power after V_{DD} is turned on and remove the RF power before V_{DD} is turned off.

Refer to the ADL8141 data sheet for the recommended resistor values to achieve different supply currents. The following bias conditions are recommended to achieve optimal performance: V_{DD} = 2 V and quiescent current (I_{DQ}) = 25 mA. I_{DQ} is typically achieved using a 768 Ω value for the bias resistance (R_{BIAS}).

RECOMMENDED BIAS SEQUENCING

During Power-Up

To power up the ADL8141-EVALZ, take the following bias sequencing steps:

1. Connect the VDD power supply.
2. Set the VDD supply to 2 V.
3. Apply the RF input signal.

During Power-Down

To power down the ADL8141-EVALZ, take the following bias sequencing steps:

1. Turn off the RF input signal.
2. Set the VDD supply to 0 V.

EVALUATION BOARD SCHEMATIC AND ARTWORK

The bias current (see Figure 4) can either be set by placing a resistor in Position R2 or by placing a resistor in Position R1 and by applying an adjustable voltage to the VBIAS pin (in this case R2 must be open).
