Note:

- *Test embient temp. $\,$ is 20 $^{\circ}\mathrm{C}$
- * If FEXT loss is greater than 90 dB up to 2000 MHz,ACR-F and PS ACR-F loss may not be calculated.
- * If AFEXT loss is greater than 90 dB up to 1000 MHz and greater than 80 dB up to 2000MHz, AACR-F loss may not be calculated. *Measurements and limits of 30 m and 100 m (according to IEC 61156-6) samples are independent. Limits for 30 m below 40 MHz are for information only (for further study).
- *Mutual capacitance, capacitance unbalance, characteristic impedance, return loss, insertion loss, NEXT loss, ACRF measurements and calculations shall be performed on cable samples of 30 m (98 ft) removed from the reel or packaging. The test sample shall be laid out along a non-conducting surface, loosely coiled, or supported in aerial spans, and allpairs shall be terminated according to the specific requirements of this annex. Other test configurations are acceptable if correlation to the reference method has been verified. In case of conflict, the reference method (30 m, off-reel, resistor terminated) shall be used to determine conformance to the minimum requirements of this Standard.
